Product Manual Using Permit Agreement

[Product Manual (hereafter the "Manual") Using Permit Agreement] hereafter the "Agreement" is the using permit of the Manual, and the relevant rights and obligations between the users and Qno Technology Inc (hereafter "Qno"), and is the exclusion to remit or limit the liability of Qno. The users who obtain the file of this manual directly or indirectly, and users who use the relevant services, must obey this Agreement.

Important Notice: Qno would like to remind the users to read the clauses of the "Agreement" before downloading and reading this Manual. Unless you accept the clauses of this "Agreement", please return this Manual and relevant services. The downloading or reading of this Manual is regarded as accepting this "Agreement" and the restriction of clauses in this "Agreement".

[1] Statement of Intellectual Property

Any text and corresponding combination, diagram, interface design, printing materials or electronic file are protected by copyright of our country, clauses of international copyright and other regulations of intellectual property. When the user copies the "Manual", this statement of intellectual property must also be copied and indicated. Otherwise, Qno regards it as tort and relevant duty will be prosecuted as well.

[2] Scope of Authority of "Manual"

The user may install, use, display and read this "Manual on the complete set of computer.

[3] User Notice

If users obey the law and this Agreement, they may use this "Manual" in accordance with "Agreement". If the users violate the "Agreement", Qno will terminate the using authority and destroy the copy of this "Manual". The "hardcopy or softcopy" of this Manual is restricted using for information, non-commercial and personal purpose. Besides, it is not allowed to copy or announce on any network computer. Furthermore, it is not allowed to disseminate on any media. It is not allowed to modify any part of the "file". Using for other purposes is prohibited by law and it may cause serious civil and criminal punishment. The transgressor will receive the accusation possibly.

[4] Legal Liability and Exclusion

[4-1] Qno will check the mistake of the texts and diagrams with all strength. However, Qno, distributors, and resellers do not bear any liability for direct or indirect economic loss, data loss or other corresponding commercial loss to the user or relevant personnel due to the possible omission.

[4-2] In order to protect the autonomy of the business development and adjustment of Qno, Qno reserves the right

to adjust or terminate the software / Manual any time without informing the users. There will be no further notice regarding the product upgrade or change of technical specification. If it is necessary, the change or termination will be announced in the relevant block of the Qno website.

- [4-3] All the set parameters are examples and they are for reference only. You may also purpose your opinion or suggestion. We will take it as reference and they may be amended in the next version.
- [4-4] This Manual explains the configuration of all functions for the products of the same series. The actual functions of the product may vary with the model. Therefore, some functions may not be found on the product you purchased.
- [4-5] Qno reserves the right to change the file content of this Manual and the Manual content may not be updated instantly. To know more about the updated information of the product, please visit Qno official website.
- [4-6] Qno (and / or) distributors hereby declares that no liability will be born for any guarantee and condition of the corresponding information. The guarantee and condition include tacit guarantee and condition about marketability, suitability for special purposes, ownership, and non-infringement. The name of the companies and products mentioned may be the trademark of the owners. Qno (and/or) the distributors do not provide the product or software of any third party company. Under any circumstance, Qno and / or distributors bear no liability for special, indirect, derivative loss or any type of loss in the lawsuit caused by usage or information on the file, no matter the lawsuit is related to agreement, omission, or other tort.

[5] Other Clauses

- [5-1] The potency of this Agreement is over any other verbal or written record. The invalidation of part or whole of any clause does not affect the potency of other clauses.
- [5-2] The power of interpretation, potency and dispute are applicable for the law of Taiwan. If there is any dissension or dispute between the users and Qno, it should be attempted to solve by consultation first. If it is not solved by consultation, user agrees that the dissension or dispute is brought to trial in the jurisdiction of the court in the location of Qno. In Mainland China, the "China International Economic and Trade Arbitration Commission" is the arbitration organization.

I. Introduction

New generation GIGABIT IPSec VPN Router is a high efficiency flagship router owing to the market requirement. It is designed as economical, high efficient with all functions integrated for network VPN Router that fulfills the requirement of enterprise branches, vendors and SOHO for VPN application increase and bandwidth management. New generation GIGABIT IPSec VPN Router focuses on multiple ISP environment and user bandwidth management requirement to integrate the gigabit backbone networking, it can support hardware port mirror, smart QoS, Multi-WAN load balance, gateway redundancy, and Intelligent Firewall.

GIGABIT IPSec VPN Router uses a high-level processor and maximum 2Gbps-two way forwarding rate that can support several hundred thousand session connections, built-in high- capacity RAM which allows the stability and reliability for long-time operation.

It provides 5 Gigabit WAN port and high-efficiency load balance mode for out-bound load balance. WAN side outbound connection performance can fulfill most of the standards for broadband market. In addition, independent DMZ port can connect to the public server by public IP address. It has a built-in 5 Gigabit backbone LAN port to appropriate for 10/100/1000Mbps Ethernet switch and each port can connect with other switches for more network devices that can build up a Gigabit backbone conveniently to accelerate the network availability and scalable bandwidth enterprise. In addition, there are 2 USB interfaces that can support other device connections, enlarge storage capacity, and other future functions.

Individual QoS bandwidth management with powerful and easy-to-setup functions allows manager to arrange the limited network resource rationally and efficiently. It is not needed to extend the bandwidth to unlimited settings which would increase spending cost; it can also avoid the complaint of few people to force whole bandwidth. Simple user configuration can be the best efficient application; it allows the optimization of bandwidth utilization based on the whole utility rate without setting rules step-by-step and only to limit the users who occupy the bandwidth for resource savings. Moreover, intelligence bandwidth management is provided, through the simple deployment to complete LAN side bandwidth management for efficiency utility rate, simple management and improvement performance.

Load balancing function supports Auto Load Balance mode, Specify WAN Binding mode and Strategy Routing mode to allow deployment of flexible network connection required to control traffic flow to guarantee that the whole connections are unobstructed. Strategy Routing mode is simply to configure the network without the input of IP address. It can automatically detect outbound packets and filter telecom connection to ensure quick response and packet pass through without obstruction, and it can aggregate the same ISP bandwidth for load balancing control and increase flexibility of network resource.

Built-in Firewall system can fulfill market requirement in defense of internet attacks for most enterprises. Initiative packet inspection via the network layer dynamic detection denies or blocks non-standard protocol connections. It can easily employ complete protection functions to ensure network security, as required for any kind of hack attacks, worm & Virus and ARP attacks by one-way control. Firewall system has not only NAT function but also DoS attack. Complete Functions of Access Rules can allow managers to select the network service levels to deny or allow accesses, and it can also limit or deny LAN users to use the network and to avoid the network resource being occupied or threatened due to improper uses.

NAT function can provide the translation between private IP and public IP, which can allow multi-user to connect the internet with one public IP at the same time. LAN IP supports four Class C connections, and DHCP server is also supported, as well as an easy configuration of IP-MAC binding function allowing network structure to be flexible and easy to be deployed and managed.

Qno is a supporter of the IPSec Protocol. IPSec VPN provides DES, 3DES, AES-128 encryption, MD5, SH1 certification, IKE Pre-Share Key, or manual password interchange. GIGABIT IPSec VPN Router also supports aggressive mode. When a connection is lost, GIGABIT IPSec VPN Router will automatically re-connect. In addition, GIGABIT IPSec VPN Router features NetBIOS transparency, and supports IP grouping for connections between clients and host in the virtual private network.

GIGABIT IPSec VPN Router offers the function of a standard PPTP server, which is equipped with connection setting status. Each WAN port can be set up with multiple DDNS at the same time. It is also capable of establishing VPN connections with dynamic IP addresses.

GIGABIT IPSec VPN Router also has unique QVM VPN- SmartLink IPSec VPN. Just input VPN server IP, user name, and password, and IPSec VPN will be automatically set up. Through GIGABIT IPSec VPN Router exclusive QVM function, users can set up QVM to work as a server, and have it accept other QVM series products from client ports. QVM offers easy VPN allocation for users; users can do it even without a network administrator. GIGABIT IPSec VPN Router enables enterprises to benefit from VPN without being troubled with technical and network management problems. The central control function enables the host to log in remote client computers at any time. Security and secrecy are guaranteed to meet the IPSec standard, so as to ensure the continuity of VPN service.

You can log on to our Web site www.Qno.com.tw, and find the latest Qno product information and technical support.

The device is an FCC Class A product, it may cause radio interference in the living environment. User may need to take feasible measures in this condition.

II. Multi-WAN Router Installation

In this chapter we are going to introduce hardware installation. Through the understanding of multi- WAN setting process, users can easily setup and manage the network, making Router functioning and having best performance.

2.1 Systematic Setting Process

Users can set up and enable the network by utilizing bandwidth efficiently. The network can achieve the ideal efficientness, block attacks, and prevent security risks at the same time. Through the process settings, users can install and operate GIGABIT Router easily. This simplifies the management and maintenance, making the user network settings be done at one time. The main process is as below:

- 1. Hardware installation
- 2. Login
- 3. Verify device specification and set up password and time
- 4. Set WAN connection
- 5. Set LAN connection: physical port and IP address settings
- 6. Set QoS bandwidth management: avoid bandwidth occupation
- 7. Set Firewall: prevent attack and improper access to network resources
- 8. Other settings: UPnP, DDNS, MAC Clone
- 9. Management and maintenance settings: Syslog, SNMP, and configuration backup
- 10. VPN Virtual Private Network, QnoKey, QVM
- 11. Logout

2.2 Setting Flow Chart

Below is the description for each setting process, and the crospondent contents and purposes. For detailed functions, please refer to Appendix I: Setting Inferface and Chapter Index.

#	Setting	Content	Purpose
1	Hardware installation	Configure the network to meet user's demand.	Install GIGABIT Router hardware based on user physical requirements.
2	Login	Login the device with Web Browser.	Login GIGABIT Router web- based UI.
3	Verify device specification Set password and time	Verify Firmware version and working status. Set time and re- new	Verify GIGABIT Router specification, Firmware version and working status. Modify the login password considering safe issue.
4	Set WAN connection	password. Verify WAN connection setting, bandwidth allocation, and protocol binding.	Synchronize the GIGABIT Router time with WAN. Connect to WAN. Configure bandwidth to optimize data transmission.
5	Set LAN connection: physical port and IP address settings	Set mirror port and VLAN. Allocate and manage LAN IP.	Provide mirror port, port management and VLAN setting functions. Support Static/DHCP IP allocation to meet different needs. IP group will simplify the management work.
6	Set QoS bandwidth management: avoid bandwidth occupation	Restrict bandwidth and session of WAN ports, LAN IP and application.	To assure transmission of important information, manage and allocate the bandwidth further to achieve best efficiency.
7	Set Firewall: prevent attack and improper access to network resources	Block attack, Set Access rule and restrict Web access.	Administrators can block BT to avoid bandwidth occupation, and enable access rules to restrict employee accessing internet improperly or using MSN, QQ and Skype during working time. They can also protect network from Worm or ARP attacking.
8	Advanced Settings: DMZ/Forwarding, UPnP, DDNS, MAC Clone	DMZ/Forwarding, UPnP, Routing Mode, multiple WAN IP, DDNS and MAC Clone	DMZ/Forwarding, UPnP, Routing Mode, multiple WAN IP, DDNS and MAC Clone

9	Management and maintenance settings: Syslog, SNMP, and configuration backup	Monitor working status and configuration backup.	Administrators can look up system log and monitor system status and inbound/outbound flow in real time.
10	VPN Virtual Private Network, QnoKey, QVM	Configure VPN tunnels, e.g. PPTP, QnoKey, QVM	Configure different types of VPN to meet different application environment.
11	Logout	Close configuration window.	Web-based UI logout.

We will follow the process flow to complete the network setting in the following chapters.

III. Hardware Installation

In this chapter we are going to introduce hardware interface as well as physical installation.

3.1 Router LED Signal

LED Signal Description

LED	Color	Description
Power	Green	Green LED on: Power ON
DIAG	Amber	Amber LED on: System self-test is running.
		Amber LED off: System self-test is completed successfully.
DMZ	Green	Green LED on: Ethernet connection is fine.
		Green LED blinking: Packets are transmitting through Ethernet port.
100M- Speed	Amber	Amber LED on: Ethernet is running at 100Mbps.
		Amber LED off: Ethernet is running at 10Mbps.
1000M-Speed	Green	Green LED on: Ethernet is running at 1000Mbps.
WAN	Green	Green LED on: WAN1 is connected and IP address has been obtained

Reset

Action	Description
Press Reset Button For 5 Secs	Warm Start
	DIAG indicator: Amber LED flashing slowly.
Press Reset Button Over 10 Secs	Factory Default
	DIAG indicator: Amber LED flashing quickly.

System Built-in Battery

A system timing battery is built into GIGABIT Router. The lifespan of the battery is about 1~2 years. If the battery life is over or it can not be charged, GIGABIT Router will not be able to record time correctly, nor synchronize with internet NTP time server. Please contact your system supplier for information on how to replace the battery.

Attention!

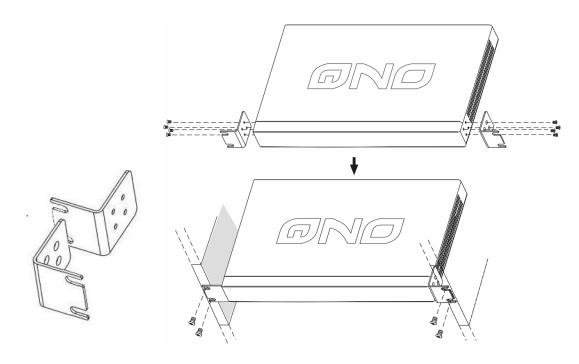

Do not replace the battery yourself; otherwise irreparable damage to the product may be caused.

Installing GIGABIT Router on a Standard 19" Rack

We suggest to either place GIGABIT Router on a desk or install it in a rack with attached brackets. Do not place other heavy objects together with GIGABIT Router on a rack. Overloading may cause the rack to fail, thus causing damage or danger.

Each GIGABIT Router comes with a set of rack installation accessories, including 2 L- shaped brackets and 8 screws. Users can rack- mount the device onto the chassis. Please refer to the figure below for the installation onto a 19" rack:

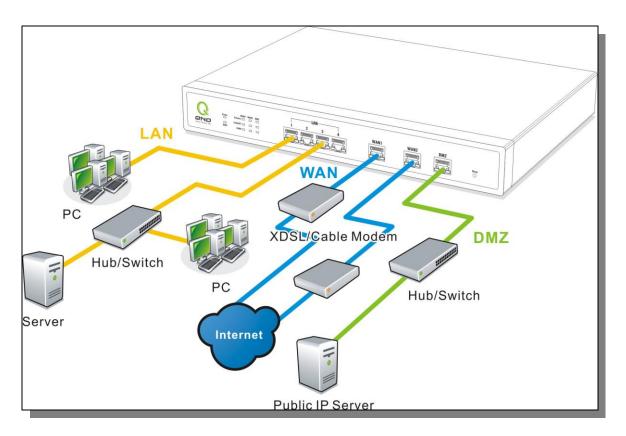

Attention!

In order for the device to run smoothly, wherever users install it, be sure not to obstruct the vent on each side of the device. Keep at least 10cm space in front of both the vents for air convection.

3.2 GIGABIT Router Network Connection

WAN connection: A WAN port can be connected with xDSL Modem, Fiber Modem, Switching Hub, or through an external router to connect to the Internet.

LAN Connection: The LAN port can be connected to a Switching Hub or directly to a PC. Users can use servers for monitoring or filtering through the port after "Physical Port Mangement" configuration is done.

DMZ: The DMZ port can be connected to servers that have legal IP addresses, such as Web servers, mail servers, etc.

IV. Login Router

This chapter is mainly introducing Web-based UI after connecting GIGABIT Router.

First, check up GIGABIT Router IP address by connecting to DOS through the LAN PC under GIGABIT Router. Go to Start → Run, enter cmd to commend DOS, and enter ipconfig for getting Default Gateway address, as the graphic below, 192.168.1.1. Make sure Default Gateway is also the default IP address of GIGABIT Router.

Attention!

When not getting IP address and default gateway by using "ipconfig", or the received IP address is 0.0.0.0 and 169.X.X.X, we recommend that users should check if there is any problem with the circuits or the computer network card is connected nicely.

Then, open webpage browser, IE for example, and key in 192.168.1.1 in the website column. The login window will appear as below:

GIGABIT Router default username and password are both "admin". Users can change the login password in the setting later.

Attention!

For security, we strongly suggest that users must change password after login. Please keep the password safe, or you can not login to GIGABIT Router. Press Reset button for more than 10 sec, all the setting will return to default.

After login, GIGABIT Router web- based UI will be shown. Select the language on the upper right corner of the webpage. The language chosen will be in blue. Please select "English' as below.

V. Device Spec Verification, Status Display and Login Password and Time Setting

This chapter introduces the device specification and status after login as well as change password and system time settings for security.

5.1 Home Page

In the Home page, all GIGABIT Router parameters and status are listed for users' reference.

5.1.1 WAN Status

WAN Status

Interface	WAN1	WAN2	WAN3	WAN4	WAN5
IP Address	0.0.0.0	0.0.0.0	0.0.0.0	0.0.0.0	192.168.4.109
Default Gateway	0.0.0.0	0.0.0.0	0.0.0.0	0.0.0.0	192.168.4.1
DNS	0.0.0.0	0.0.0.0	0.0.0.0	0.0.0.0	192.168.5.120
Session	0	0	0	0	0
Downstream Bandwidth Usage(%)	0	0	0	0	0
Upstream Bandwidth Usage(%)	0	0	0	0	0
DDNS Setup	Dyndns Disabled 3322 Disabled Qnoddns Disabled				
Quality of Service	0 rules set				
Manual Connect	Release Renew	Release Renew	Release Renew	Release Renew	Release Renew

IP Address	Indicates the current IP configuration for WAN port.
Default Gateway	Indicates current WAN gateway IP address from ISP.
DNS Server	Indicates the current DNS IP configuration.
Session	Indicates the current session number for each WAN in GIGABIT Router.
Downstream Bandwidth Usage(%)	Indicates the current downstream bandwidth usage(%) for each WAN.

Upstream Bandwidth Usage(%)	Indicates the current upstream bandwidth usage(%) for each WAN.
DDNS	Indicates if Dynamic Domain Name is activated. The default configuration is "Off".
Quality of Service	Indicates how many QoS rules are set.
Manual Connect	When "Obtain an IP automatically" is selected, two buttons (Release and Renew) will appear. If a WAN connection, such as PPPoE or PPTP, is selected, "Disconnect" and "Connect" will appear.
DMZ IP Address (WAN5/DMZ)	Indicates the current DMZ IP address.

5.1.2 Physical Port Status

Physical Port Status

Port ID	1	2	3	4	5
Interface			LAN		
Status	Enabled	Connect	Enabled	Enabled	Enabled
Port ID	Internet	Internet	Internet	Internet	Internet
Interface	WAN1	WAN2	WAN3	WAN4	WAN5
Status	<u>Enabled</u>	<u>Enabled</u>	Enabled	<u>Enabled</u>	Connect

The status of all system ports, including each connected and enabled port, will be shown on this Home page (see above table). Click the respective status button and a separate window will appear to show detailed data (including setting status summary and statisites) of the selected port.

ummary	10Base-T / 100Base-TX / 1000Base-T
Туре	10base-1 / 100base-1X / 1000base-1
Interface	LAN
Link Status	Up
Physical Port Status	Port Enabled
Priority	Normal
Speed Status	100 Mbps
Duplex Status	Full
Auto Neg.	Enabled
VLAN	VLAN1
tatistics	
Receive Packets Count	3050
Receive Packets Byte Count	426713
Transmit Packets Count	7963
Transmit Packets Byte Count	1876468
Error Packets Count	0

The current port setting status information will be shown in the Port Information Table. Examples: type (10Base-T/100Base-TX/) , iniferface (WAN $1\sim4$ /LAN $1\sim8$ /DMZ) , link status (Up/ Down) , physical port status (Port Enabled/ Port Disabled) , priority (high or normal) , speed status (10Mbps/100Mbps) , duplex status (Half/ Full) , auto negotiation (Enabled or Disabled). The tabble also shows statistics of Receive/ Transmit Packets, Receive/Transmit Packets Byte Count as well as Error Packets Count.

5.1.3 System Information

System Information

LAN IP/Subnet Mask	192.168.1.1/255.255.255.0	Serial Number	Qnoz74L1000123754
Working Mode	Gateway	Firmware Version	v1.2.01 .13 (Nov 26 2009
System Active Time	0 Days 0 Hours 12 Minutes 6 Seconds		10:11:59) Wed Dec 2 2009 20:11:11
	Coonido		
CPU Usage	N/A		
Memory Usage	N/A		
Total Session	N/A		
Advance			

Device IP Address: Identifies the current device IP address. The default is 192.168.1.1.

Working Mode: Indicates the current working mode. Can be NAT Gateway or Router mode. The default is "NAT Gateway" mode.

System active time: Indicates how long the GIGABIT Router has been running.

Serial Number: This number is the GIGABIT Router serial number.

Firmware Version: Information about the GIGABIT Router present software version.

Current Time: Indicates the device present time. Please note: To have the correct time, users must synchronize the device with the remote NTP server first.

CPU Usage: Indicates the current router CPU usage percentage.

Memory Usage: Indicates the current router memory usage percentage.

Total Session: Indicates the current router session connection quantity.

5.1.4 Firewall Status

Security Status

Firewall	Status
SPI (Stateful Packet Inspection)	On
DoS (Denial of Service)	On
Block WAN Request	Off
Prevent ARP Virus Attack	On
Remote Management	Off
Access Rule	0 rules set

SPI (Stateful Packet Inspection): Indicates whether SPI (Stateful Packet Inspection) is on or off. The default configuration is "On".

DoS (Denial of Service): Indicates if DoS attack prevention is activated. The default configuration is "On".

Block WAN Request: Indicates that denying the connection from Internet is activated. The default configuration is "On".

Prevent ARP Virus Attack: Indicates that preventing Arp virus attack is acitvated. The default configuration is "Off".

Remote Management: Indicates if remote management is activated (on or off). Click the hyperlink to enter and manage the configuration. The default configuration is "Off".

Access Rule: Indicates the number of access rule applied.

5.1.5 Log Setting Status

Log Setting Status

External SyslogServer	Disabled
Send Log by E-mail	Disabled

External Syslog Server Indicates the sever setting to receive the syslog.

Send Log by E-mail (future feature)

Indicates the E-mail setting. Syslog will be sent to the specific E-mail.

E-Mail link will be connected to syslog setting page:

- If you do not have the email address set in system log, it will show "E-mail cannot be sent because you
 have not specified an outbound SMTP server address."—— represents that you do not have email
 setting and it can not send out syslog emails.
- 2. If you have the email address set in system log, but the log does not meet the sending log conditions, it will show "E-mail settings have been configured."—— represents that you already have the email setting, but the log does not meet the sending log conditions yet.
- 3. If you have the email address set in system log, and log is sent out, it will show "E-mail settings have been configured and sent out normally." —— represents that you already have the email setting, and the log is set out to the email address.
- 4. If you have the email address set in the system log, but the log can not be sent out correctly, it will show "E-mail cannot be sent out, probably use incorrect settings." —— represents that there is email address setting, but the log can not be sent out, which might be due to the incorrect setting.

5.2 Change and Set Login Password and Time

5.2.1 Password Setting

When you login GIGABIT Router setting window every time, you must enter the password. The default value for GIGABIT Router username and password are both "admin". For security reasons, we strongly recommend that you must change your password after first login. Please keep the password safe, or you might not login to GIGABIT Router. You can press Reset button for more than 10 sec, GIGABIT Router will return back to default.

Password Setup

User Name	admin
Old Password	
New User Name	admin
New Password	
Confirm New Password	

User Name	The default is "admin".	
Old Password	Input the original password. (The default is "admin".)	
New User Name	Input the new user name. i.e.Qno	
New User Password	Input the new password.	
Confirm New Password	Input the new password again for verification.	
Apply	Click "Apply" to save the configuration.	
Cancel	Click "Cancel" to leave without making any change. This action will be effective	
	before "Apply" to save the configuration.	

5.2.2 Time

GIGAGIT Router can adjust time setting. Users can know the exact time of event occurrences that are recorded in the Syslog, and the time of turning on or off access for Internet resources. You can either select the embedded NTP

Server synchronization function or set up a time reference.

Synchronize with external NTP server: GIGABIT Router has embedded NTP server, which will update the time spontaneously.

Set the local time using Network Time Protocol (NTP) automatically Set the local time Manually Time Zone Daylight Saving Daylight Saving NTP Server Beijing (GMT+08:00) Enabled from 66 Month 25 Dayto 12 Month 25 Day NTP Server Cancel

Time Zone	Select your location from the pull-down time zone list to show correct local time.	
Daylight Saving	If there is Daylight Saving Time in your area, input the date range. The device will adjust	
	the time for the Daylight Saving period automatically.	
NTP Server	If you have your own preferred time server, input the server IP address.	
Apply	After the changes are completed, click "Apply" to save the configuration.	
Cancel	Click "Cancel" to leave without making any change. This action will be effective	
	before "Apply" to save the configuration.	

Select the Local Time Manually: Input the correct time, date, and year in the boxes.

Set the local time using Network Time Protocol (NTP) automatically Set the local time Manually 21 Hours 37 Minutes 46 Seconds 12 Month 2 Day 2009 Year Apply Cancel

After the changes are completed, click "Apply" to save the configuration. Click "Cancel" to leave without making any change. This action will be effective before "Apply" to save the configuration.

VI · Network Configuration

This Network page contains the basic settings. For most users, completing this general setting is enough for connecting with the Internet. However, some users need advanced information from their ISP. Please refer to the following descriptions for specific configurations.

6.1 Network Connection

LAN Setting

WAN Setting

Interface	Connection Type	Config.
WAN 1	Obtain an IP automatically	<u>Edit</u>
WAN 2	Obtain an IP automatically	<u>Edit</u>

WAN 4	Obtain an IP automatically	<u>Edit</u>
WAN 5	Obtain an IP automatically	<u>Edit</u>

6.1.1 Host Name and Domain Name

Host Name :	SMB	(Required by some ISPs)
Domain Name :	smb. com	(Required by some ISPs)

Device name and domain name can be input in the two boxes. Though this configuration is not necessary in most environments, some ISPs in some countries may require it.

6.1.2 LAN Setting

This is configuration information for the GIGABIT Router current LAN IP address. The default configuration is 192.168.1.1 and the default Subnet Mask is 255.255.255.0. It can be changed according to the actual network structure.

MAC Address OO _ 78 _ 78 _ 78 _ 11 _ CD (Default:00-78-78-78-11-cd) Device IP Address: 192.168.1.1 Subnet Mask: 255.255.255.0 Multiple Subnet Setting Disabled Unified IP Management

Multiple-Subnet Setting:

Click "Unified IP Management" to enter the configuration page, as shown in the following figure. Input the respective IP addresses and subnet masks.

LAN Setting

Device IP A	ddress 192 . 168	. 1 . 1	Subnet Mask 255 , 255 , 255 , 0	
Multiple Subnet Setting	☐ Multiple Subn	et		
		LAN IP Addre	ss	
		Subnet Ma	sk	
			Add to list	
		Ď.	elete selected Subnet	

Dynamic IP

▼ EnableDHCP Server

	Subnet1	Subnet2	Subnet3	Subnet4
DHCP Server	✓ Enable	☐ Enable	☐ Enable	☐ Enable
IP Range Start	192 168 1 100	192 168 2 100	192 168 3 100	192 168 4 100
IP Range End	192 168 1 149	192 168 2 149	192 168 3 149	192 168 4 149
Apply Cancel				

This function enables users to input IP segments that differ from the router network segment to the multi-net segment configuration; the Internet will then be directly accessible. In other words, if there are already different IP segment groups in the Intranet, the Internet is still accessible without making any changes to internal PCs. Users can make changes according to their actual network structure.

6.1.3 WAN & DMZ Settings

WAN Setting:

WAN Setting

Interface	Connection Type	Config.
WAN 1	Obtain an IP automatically	<u>Edit</u>
WAN 2	Obtain an IP automatically	<u>Edit</u>
WAN 3	Obtain an IP automatically	<u>Edit</u>
WAN 4	Obtain an IP automatically	<u>Edit</u>
WAN 5	Obtain an IP automatically	<u>Edit</u>

Interface: An indication of which port is connected.

Connection Type: Obtain an IP automatically, Static IP connection, PPPoE (Point-to-Point Protocol over Ethernet), PPTP (Point-to-Point Tunneling Protocol) or Transparent Bridge.

Config.: A modification in an advanced configuration: Click Edit to enter the advanced configuration page.

Obtain an Automatic IP automatically:

This mode is often used in the connection mode to obtain an automatic DHCP IP. This is the device system default connection mode. It is a connection mode in which DHCP clients obtain an IP address automatically. If having a different connection mode, please refer to the following introduction for selection of appropriate configurations. Users can also set up their own DNS IP address. Check the options and input the user-defined DNS IP addresses.

	Interface: WAN1	
WAN Connection Type	Obtain on ID automotically	
WAN Connection Type:	Obtain an IP automatically	
Us	e the Following DNS Server Addresses	
DNSServer(Required):	0.0.0.0	
DNS Server(Optional):	0.0.0.0	
☐ EnabledLine-Dropped Scheduling		
Line-Dropped Period	d: from 0 : 0 to 1 : 0 (24-Hour Format)	
Line-Dropped Scheduling	g: 5 minutes ahead line-dropped to start new session transferring	
Backup Interface	e: disable 🕶	
Back Apply Cancel		

Use the following DNS Server

Select a user-defined DNS server IP address.

Addresses

DNS Server

Input the DNS IP address set by ISP. At least one IP group should be input. The $\,$

maximum acceptable groups is two IP groups.

Enable Line-Dropped Scheduling

The WAN disconnection schedule will be activated by checking this option. In some areas, there is a time limitation for WAN connection service. For example: the optical fiber service will be disconnected from 0:00 am to 6:00 am. Although there is a standby system in the device, at the moment of WAN disconnection, all the external connections that go through this WAN will be disconnected too. Only after the disconnected lines are reconnected can they go through the standby system to connect with the Internet. Therefore, to avoid a huge number of disconnection, users can activate this function to arrange new connections to be made through another WAN to the Internet. In this way, the effect of any disconnection can be minimized.

Line-Dropped Period

Input the time rule for disconnection of this WAN service.

Line-Dropped Scheduling

Input how long the WAN service may be disconnected before the newly added connections should go through another WAN to connect with the Internet.

Backup Interface

Select another WAN port as link backup when port binding is configured. Users should select the port that employs the same ISP.

After the changes are completed, click "Apply" to save the configuration, or click "Cancel" to leave without making any changes.

Static IP:

If an ISP issues a static IP (such as one IP or eight IP addresses, etc.), please select this connection mode and follow the steps below to input the IP numbers issued by an ISP into the relevant boxes.

	Interface: WAN1
WAN Connection Type:	Static IP 💌
WAN IP Address:	0 . 0 . 0 . 0
Subnet Mask:	255 _ 255 _ 0
Default Gateway:	0 . 0 . 0 . 0
DNSServer(Required):	0 . 0 . 0 . 0
DNSServer(Optional):	0 . 0 . 0 . 0
☐ EnabledLine-Dropped Scheduling	
Line-Dropped Period: from 0 : 0 to 1 : 0 (24-Hour Format)	
Line-Dropped Scheduling : 5 minutes ahead line-dropped to start new session transferring	
Backup Interface	e: disable v
Back Apply Cancel	

WAN IP address:	Input the available static IP address issued by ISP.
Subnet Mask:	Input the subnet mask of the static IP address issued by ISP, such as: Issued eight static IP addresses: 255.255.255.248
	Issued 16 static IP addresses: 255.255.255.240
Default Gateway:	Input the default gateway issued by ISP. For ADSL users, it is usually an ATU-R IP address. As for optical fiber users, please input the optical fiber switching IP.

DNS Server: Enable Line-Dropped	Input the DNS IP address issued by ISP. At least one IP group should be input. The maximum acceptable is two IP groups.
Scheduling	The WAN disconnection schedule will be activated by checking this option. In some areas, there is a time limitation for WAN connection service. For example: the optical fiber service will be disconnected from 0:00 am to 6:00 am. Although there is a standby system in the device, at the moment of WAN disconnection, all the external connections that go through this WAN will be disconnected too. Only after the disconnected lines are reconnected can they go through the standby system to connect with the Internet. Therefore, to avoid a huge number of disconnection, users can activate this function to arrange new connections to be made through another WAN to the Internet. In this way, the effect of any disconnection can be minimized.
Line-Dropped Period	Input the time rule for disconnection of this WAN service.
Line-Dropped Scheduling	Input how long the WAN service may be disconnected before the newly added connections should go through another WAN to connect with the Internet.
Backup Interface	Select another WAN port as link backup when port binding is configured. Users should select the port that employs the same ISP.

After the changes are completed, click "Apply" to save the configuration, or click "Cancel" to leave without making any changes.

PPPoE:

This option is for an ADSL virtual dial-up connection (suitable for ADSL PPPoE). Input the user connection name and password issued by ISP. Then use the PPP Over-Ethernet software built into the device to connect with the Internet. If the PC has been installed with the PPPoE dialing software provided by ISP, remove it. This software will no longer be used for network connection.

	Interface: WAN1
WAN Connection Type:	PPPoE 💌

Line-Dropped Period	1: from 0 : 0 to 1 : 0 (24-Hour Format)
Line-Dropped Scheduling : 5 minutes ahead line-dropped to start new session transferring	
Backup Interface	e: disable 🕶
	Back Apply Cancel

User Name	
	Input the user name issued by ISP.
Password	Input the password issued by ISP.
Connect on Demand	This function enables the auto-dialing function to be used in a PPPoE dial connection. When the client port attempts to connect with the Internet, the device will automatically make a dial connection. If the line has been idle for a period of time, the system will break the connection automatically. (The default time for automatic break-off resulting from no packet transmissions is five minutes).
Keep Alive	This function enables the PPPoE dial connection to keep connected, and to automatically redial if the line is disconnected. It also enables a user to set up a time for redialing. The default is 30 seconds.
Enable Line-Dropped Scheduling	The WAN disconnection schedule will be activated by checking this option. In some areas, there is a time limitation for WAN connection service. For example: the optical fiber service will be disconnected from 0:00 am to 6:00 am.

	Although there is a standby system in the device, at the moment of WAN disconnection, all the external connections that go through this WAN will be disconnected too. Only after the disconnected lines are reconnected can they go through the standby system to connect with the Internet. Therefore, to avoid a huge number of disconnection, users can activate this function to arrange new connections to be made through another WAN to the Internet. In this way, the effect of any disconnection can be minimized.
Line-Dropped Period	Input the time rule for disconnection of this WAN service.
Line-Dropped Scheduling	Input how long the WAN service may be disconnected before the newly added connections should go through another WAN to connect with the Internet.
Backup Interface	Select another WAN port as link backup when port binding is configured. Users should select the port that employs the same ISP.

After the changes are completed, click "Apply" to save the configuration, or click "Cancel" to leave without making any change.

PPTP:

This option is for the PPTP time counting system. Input the user's connection name and password issued by ISP, and use the built-in PPTP software to connect with the Internet.

	Interface: WAN1
WAN IP Address: 0 . 0 . 0 . 0 Subnet Mask: 255 . 255 . 255 . 0 Default Gateway: 0 . 0 . 0 . 0 UserName: Password: Connect on Demand: Max Idle Time 5 Min. Keep Alive: Redial Period 30 Sec.	
EnabledLine-Dropped Scheduling Line-Dropped Period: from □ : □ to □ : □ (24-Hour Format) Line-Dropped Scheduling: minutes ahead line-dropped to start new session transferring Backup Interface: disable ✓	
Back Apply Cancel	

WAN IP Address	This option is to configure a static IP address. The IP address to be configured could be one issued by ISP. (The IP address is usually provided by the ISP when the PC is installed. Contact ISP for relevant information).
Subnet Mask	Input the subnet mask of the static IP address issued by ISP, such as: Issued eight static IP addresses: 255.255.255.248 Issued 16 static IP addresses: 255.255.255.240
Default Gateway Address	Input the default gateway of the static IP address issued by ISP. For ADSL users, it is usually an ATU-R IP address.
User Name	Input the user name issued by ISP.
Password	Input the password issued by ISP.

Connect on Demand	This function enables the auto-dialing function to be used for a PPTP dial connection. When the client port attempts to connect with the Internet, the device will automatically connect with the default ISP auto dial connection; when the network has been idle for a period of time, the system will break the connection automatically. (The default time for automatic break off when no packets have been transmitted is five minutes).
Keep Alive	This function enables the PPTP dial connection to redial automatically when the connection has been disconnected. Users can set up the redialing time. The default is 30 seconds.
Enable Line-Dropped Scheduling	The WAN disconnection schedule will be activated by checking this option. In some areas, there is a time limitation for WAN connection service. For example: the optical fiber service will be disconnected from 0:00 am to 6:00 am. Although there is a standby system in the device, at the moment of WAN disconnection, all the external connections that go through this WAN will be disconnected too. Only after the disconnected lines are reconnected can they go through the standby system to connect with the Internet. Therefore, to avoid a huge number of disconnection, users can activate this function to arrange new connections to be made through another WAN to the Internet. In this way, the effect of any disconnection can be minimized.
Line-Dropped Period	Input the time rule for disconnection of this WAN service.
Line-Dropped Scheduling	Input how long the WAN service may be disconnected before the newly added connections should go through another WAN to connect with the Internet.
Backup Interface	Select another WAN port as link backup when port binding is configured. Users should select the port that employs the same ISP.

After the changes are completed, click "Apply" to save the configuration, or click "Cancel" to leave without making any changes.

Transparent Bridge:

If all Intranet IP addresses are applied as Internet IP addresses, and users don't want to substitute private network

IP addresses for all Intranet IP addresses (ex. 192.168.1.X), this function will enable users to integrate existing networks without changing the original structure. Select the Transparent Bridge mode for the WAN connection mode. In this way, users will be able to connect normally with the Internet while keeping the original Internet IP addresses in Intranet IP configuration.

If there are two WANs configured, users still can select Transparent Bridge mode for WAN connection mode, and load balancing will be achieved as usual.

	Interface: \mathbb{WAN1}
WAN Connection Type:	Transparent Bridge
WAN IP Address:	0 . 0 . 0
Subnet Mask :	255 _ 255 _ 0
Default Gateway:	0 . 0 . 0

You can also setup the default gateway and IP range in the group 2.

Enable Line-Dropped

The WAN disconnection schedule will be activated by checking this option. In some areas, there is a time limitation for WAN connection service. For example: the optical fiber service will be disconnected from 0:00 am to 6:00 am. Although there is a standby system in the device, at the moment of WAN disconnection, all the external connections that go through this WAN will be disconnected too. Only after the disconnected lines are reconnected can they go through the standby system to connect with the Internet. Therefore, to avoid a huge number of disconnection, users can activate this function to arrange new connections to be made through another WAN to the Internet. In this way, the effect of any disconnection can be minimized.

Line-Dropped Period

Input the time rule for disconnection of this WAN service.

Line-Dropped Scheduling

Input how long the WAN service may be disconnected before the newly added connections should go through another WAN to connect with the Internet.

Backup Interface

Select another WAN port as link backup when port binding is configured.

Users should select the port that employs the same ISP.

Click "Apply" to save the configuration, or click "Cancel" to leave without making any changes.

DMZ Setting:

For some network environments, an independent DMZ port may be required to set up externally connected servers such as WEB and Mail servers. Therefore, the device supports a set of independent DMZ ports for users to set up connections for servers with real IP addresses. The DMZ ports act as bridges between the Internet and LANs.

For some Qno models, the WAN5 and DMZ port can be configurable each other. You can depend on the real environment to choose which the port is WAN5 or DMZ.

enable DMZ

DMZ Setting

WAN 4	Auto	<u>Edit</u>

Network Service Detection

6.2.1 Load Balance Mode

Mode

Auto Load Balance Mode :	Mode:	By Session	Advanced Function	O By IP
Unbinding WAN Balance	Un-binding WAN Balance Mode:	O By Session	Advanced Function	O By IP
Strategy Routing	Mode:	O By Session	Advanced Function	O By IP
	Set WAN Grouping			
	China Netcom Disabled	Import IP R	ange	
	Self-defined Strategy 1 Disabled	•		
	Self-defined Strategy2 Disabled	•		

Auto Load Balance Mode:

When Auto Load Balance mode is selected, the device will use sessions or IP and the WAN bandwidth automatically allocate connections to achieve load balancing for external connections. The network bandwidth is set by what users input for it. For example, if the upload bandwidth of both WANs is 512Kbit/sec, the automatic load ratio will be 1:1; if one of the upload bandwidths is 1024Kbit/sec while the other is 512Kbit/sec, the automatic load ratio will be 2:1. Therefore, to ensure that the device can balance the actual network load, please input real upload and download bandwidths.

Session Balance: If "By Session" is selected, the WAN bandwidth will automatically allocate connections based on session number to achieve network load balance.

IP Session Balance: If "By IP" is selected, the WAN bandwidth will automatically allocate connections based on IP amount to achieve network load balance.

Note!

For either session balancing or IP connection balancing, collocation with Protocol Binding will provide a more flexible application for bandwidth. Users can assign a specific Intranet IP to go through a specific service provider for connection, or assign an IP for a specific destination to go through the WAN users assign to connect with the Internet.

For example, if users want to assign IP 192.168.1.100 to go through WAN 1 when connecting with the Internet, or assign all Intranet IP to go through WAN 2 when connecting with servers with port 80, or assign all Intranet IP to go through WAN 1 when connecting with IP 211.1.1.1, users can do that by

configuring "Protocol Binding".

Attention! When the Auto Load Balance mode is collocated with Protocol Binding, only IP addresses or servers that are configured in the connection rule will follow the rule for external connections; those which are not configured in the rule will still follow the device Auto Load Balance system.

Please refer to the explanations in **6.2.3 Configuring Protocol Binding** for setting up Protocol Binding and for examples of collocating router modes with Protocol Binding.

Un-binding WAN Balance Mode:

This mode enables users to assign specific intranet IP addresses, destination application service ports or destination IP addresses to go through an assigned WAN for external connection. After being assigned, the specific WAN will only support those assigned Intranet IP addresses, specific destination application service ports, or specific destination IP addresses. Intranet IP, specific destination application service ports and specific destination IP that is not configured under the rules will go through other WANs for external connection. For unassigned WANs, users can select Load Balance mode and select session or IP for load balancing.

If you don't specified IP address \ TCP/UDP port or destination IP addresses in WAN ports, you can still use "Session Balance" and "IP Balance" mechanisms to fulfill load balancing. Detail of these two mechanisms are as following.

Session Balance: If "By Session" is selected, the WAN bandwidth will automatically allocate connections based on session number to achieve network load balance.

IP Balance: If "By IP" is selected, the WAN bandwidth will automatically allocate connections based on the number of IP addresses to achieve network load balance.

Note!

Only when a device assignment is collocated with Protocol Binding can the balancing function be brought into full play. For example, an assignment requiring all Intranet IP addresses to go through WAN 1 when connecting with service port 80, or go through WAN 1 when connecting with IP 211.1.1.1, must be set up in the Protocol Binding Configuration.

Attention: When assigning mode is selected, as in the above example, the IP(s) or service provider(s) configured in the connection rule will follow the rule for external connections, but those which are not configured in the rule will still follow the device Load Balance system to go through other WAN ports to connect with the Internet.

Please refer to the explanations in 6.2.3 Configuring Protocol Binding for setting up Protocol Binding and

for examples of collocating router mode with Protocol Binding.

Strategy Routing Mode:

If strategy Routing is selected, the device will automatically allocate external connections based on routing policy (Division of traffic between Telecom and Netcom is to be used in China) embedded in the device. All you have to do is to select the WAN (or WAN group) which is connected with Netcom; the device will then automatically dispatch the traffic for Netcom through that WAN to connect with the Internet and dispatch traffic for Telecom to go through the WAN connected with Telecom to the Internet accordingly. In this way, the traffic for Netcom and Telecom can be divided.

Set WAN Grouping:

If more than one WAN is connected with Netcom, to apply a similar division of traffic policy to these WANs, a combination for the WANs must be made. Click "Set WAN Grouping"; an interactive window as shown in the figure below will be displayed.

Name	To define a name for the WAN grouping in the box, such as "Education" etc. The name is for recognizing different WAN groups.
Interface	Check the boxes for the WANs to be added into this combination.
Add To List	To add a WAN group to the grouping list.

Delete selected	To remove selected WANs from the WAN grouping.
Apply	Click "Apply" to save the modification.
Cancel	Click "Cancel" to cancel the modification. This only works before "Apply" is clicked.

After the configuration is completed, in the China Netcom Policy window users can select WANs in combination to connect with Netcom.

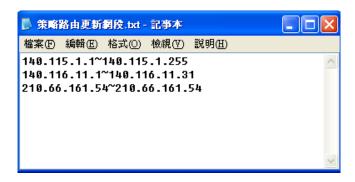

Import Strategy:

A division of traffic policy can be defined by users too. In the "Import IP Range" window, select the WAN or WAN group (ex. WAN 1) to be assigned and click the "Import IP Range" button; the dialogue box for document importation will be displayed accordingly. A policy document is an editable text document. It may contain a destination IP users designated. After the path for document importation has been selected, click "Import", and then at the bottom of the configuration window click "Apply". The device will then dispatch the traffic to the assigned destination IP through the WAN (ex. WAN 1) or WAN grouping users designated to the Internet.

To build a policy document users can use a text-based editor, such as Notepad, which is included with Windows system. Follow the text format in the figure below to key in the destination IP addresses users want to assign. For example, if the destination IP address range users want to designate is 140.115.1.1 ~ 140.115.1.255, key in 140.115.1.1 ~ 140.115.1.255 in Notepad. The next destination IP address range should be keyed in the next line. Attention! Even if only one destination IP address is to be assigned, it should follow the same format. For example, if the destination IP address is 210.66.161.54, it should be keyed in as 210.66.161.54~210.66.161.54. After the document has been saved (the extension file name is .txt), users can import the IP range of self-defined strategy.

Note!

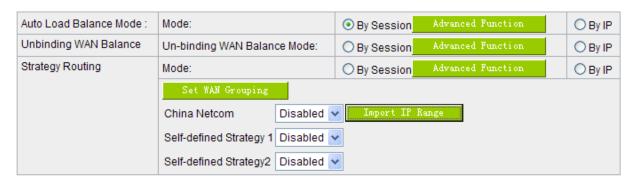

China Netcom strategy and self-defined strategy can coexist. However, if a destination IP is assigned by both China Netcom strategy and self-defined strategy, China Netcom strategy will take priority. In other words, traffic to that destination IP will be transmitted through the WAN (or WAN group) under China Netcom strategy.

Session Balance Advanced Function

In general, session balance is to equally and randomly distribute the session connections of each intranet IP. For some special connections, for example, web banking encrypted connection (Https or TCP443), is required to connect from the same WAN IP. If one intranet IP visits web banking website and the connection is distributed into different WAN IP addresses, there will be disconnection or failure. Session balance advanced function targets at solving this issue.

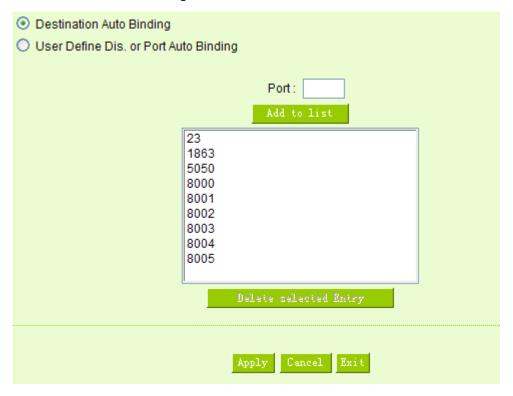

Session balance advanced function can set the same intranet IP keeps having sessions from the same WAN IP for some specific service protocols. Other service protocols can still adopt the original balance mechanism to distribute the sessions equally and randomly. With the original session balance efficiency, advanced function can ensure the connection running without error for some special service protocols.

Mode

Click "Advanced Function" to enter the setting window:

Destination Auto Binding

Indicates that the session will be connected with the same WAN IP when the destination IP is in the same Class B range.

For example, there are WAN1-1 200.10.10.1 and WAN2- 200.10.10.2, and two intranet IP addresses. When 192.168.1.100 visits Internet 61.222.81.100 for the first time, the connection is through WAN1- 200.10.10.1. If the next destination is to 61.222.81.101 (in the same Class B range), the connection will also be through WAN1-200.10.10.1. If the destination is to other IP not in the same Class B range as 61.222.81.100, the session will be distributed in the original session balance mechanism.

When the other intranet IP 192.168.1.101 visits 61.222.81.101 for the first time, the connection is through WAN2-200.10.10.2. If the next destination is to 61.222.81.100 (in the same Class B range), the connection will also be through WAN2 200.10.10.2. If the destination is to other IP not in the same Class B range as 61.222.81.100), the session will be distributed in the original session balance mechanism.

Note!

Not all intranet IP will visit the same Class B range with the same WAN IP. It depends on which WAN the first connection goes to. If the destination IP is in the same Class B range, the connection will go through with the same WAN IP based on the first time learning.

User Define Dis. Or Port Auto Binding

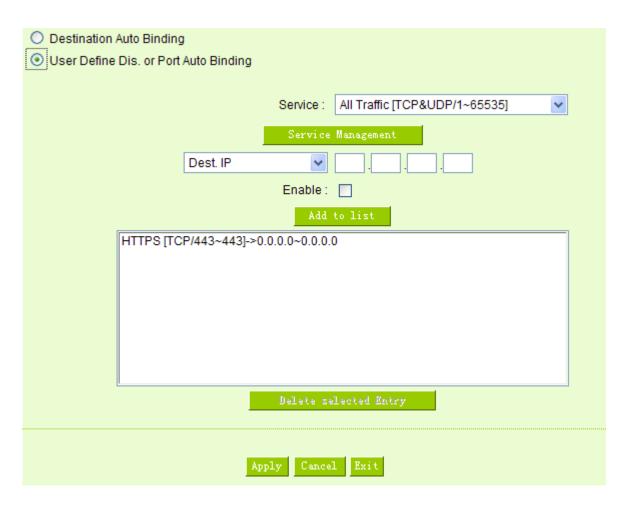

Indicates that the intranet IP will connect through the same WAN IP when the service ports are self- defined.

You can self- define the service ports and destination IP. (If the destination IP is set as 0.0.0.0 to 0, this represents that the destination is to any IP range.)

Note!

You can only choose either **Destination Auto Binding** or **User Define Dis. Or Port Auto Binding**.

Take default rules for example:

When any intranet IP connects with TCP443 port or any destination (0.0.0.0 to 0 represents any destination), it will go through the same WAN IP. As for which WAN will be selected, this follows the first- chosen WAN IP distributed by the original session balance mechanism. For example, there are two intranet IP- 192.168.100.1 and 192.168.100.2. When these intranet IPs first connects with TCP443 port, 192.168.100.1 will go through WAN1, and 192.168,100.2 will go through WAN2. Afterwards, 192.168.100.1 will go through WAN1 when there are TCP443 port connections.

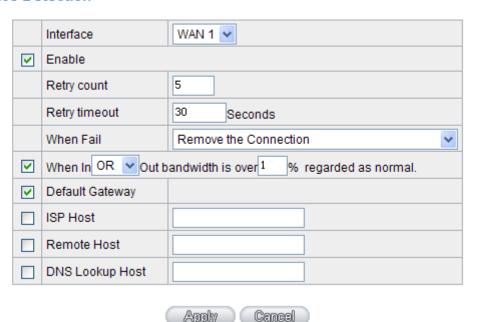

192.168.100.2 will go through WAN2 when there are TCP443 port connections.

This rule is by default. You can delete or add rules to meet your connection requirement.

6.2.2 Network Detection Service

This is a detection system for network external services. If this option is selected, information such "Retry" or "Retry Timeout" will be displayed. If two WANs are used for external connection, be sure to activate the NSD system, so as to avoid any unwanted break caused by the device misjudgment of the overload traffic for the WAN.

Network Service Detection

Interface	Select the WAN Port that enables Network Service Detection.
Retry count	This selects the retry times for network service detection. The default is five times. If there is no feedback from the Internet in the configured "Retry Times", it will be judged as "External Connection Disconnected".
Retry Timeout	Delay time for external connection detection latency. The default is 30 seconds. After the retry timeout, external service detection will restart.

When Fail

(1) Generate the Error Condition in the System Log: If an ISP connection failure is detected, an error message will be recorded in the System Log. This line will not be removed; therefore, the some of the users on this line will not have normal connections.

This option is suitable under the condition that one of the WAN connections has failed; the traffic going through this WAN to the destination IP cannot shift to another WAN to reach the destination. For example, if users want the traffic to $10.0.0.1 \sim 10.254.254.254$ to go only through WAN1, while WAN2 is not to support these destinations, users should select this option. When the WAN1 connection is disconnected, packets for $10.0.0.1 \sim 10.254.254.254$ cannot be transmitted through WAN 2, and there is no need to remove the connection when WAN 1 is disconnected.

(2) Keep System Log and Remove the Connection: If an ISP connection failure is detected, no error message will be recorded in the System Log. The packet transmitted through this WAN will be shifted to the other WAN automatically, and be shifted back again when the connection for the original WAN is repaired and reconnected.

This option is suitable when one of the WAN connections fails and the traffic going through this WAN to the destination IP should go through the other WAN to reach the destination. In this way, when any of the WAN connections is broken, other WANs can serve as a backup; traffic can be shifted to a WAN that is still connected.

Detecting Feedback Servers:

Default Gateway

The local default communication gateway location, such as the IP address of an ADSL router, will be input automatically by the device. Therefore, users just need to check the option if this function is needed. Attention! Some gateways of an ADSL network will not affect packet detection. If users have an optical fiber box, or the IP issued by ISP is a public IP and the gateway is located at the port of the net café rather than at the IP provider's port, do not activate this option.

ISP Host

This is the detected location for the ISP port, such as the DNS IP address of ISP.

	When configuring an IP address for this function, make sure this IP is capable of receiving feedback stably and speedily. (Please input the DNS IP of the ISP port)
Remote Host	This is the detected location for the remote Network Segment. This Remote Host IP should better be capable of receiving feedback stably and speedily. (Please input the DNS IP of the ISP port).
DNS Lookup Host	This is the detect location for DNS. (Only a web address such as www.hinet.net is acceptable here. Do not input an IP address.) In addition, do not input the same web address in this box for two different WANs.

Note!

In the load balance mode for Assigned Routing, the first WAN port (WAN1) will be saved for the traffic of the IP addresses or the application service ports that are not assigned to other WANs (WAN2, WAN3, and WAN4). Therefore, in this mode, we recommend assigning one of the connections to the first WAN. When other WANs (WAN2, WAN3, or WAN4) are broken and connection error remove (Remove the Connection) has been selected for the connection detection system, traffic will be shifted to the first WAN (WAN1). In addition, if the first WAN (WAN1) is broken, the traffic will be shifted to other WANs in turn. For example, the traffic will be shifted to WAN2 first; if WAN2 is broken too, the traffic will be shifted to WAN3, and so on.

6.2.3 Protocol Binding

Interface Configuration

GIGABIT Router allows maximum four WAN interface, the bandwidth and real connection of every WAN will impact the load balance mechanism; therefore you need to set the Bandwidth and the Network service detection by each WAN Port correctly.

In "Interface Configuration", click "Edit" to enter the WAN port configuration.

Interface

Interface	Mode	Config.
WAN 1	Auto	<u>Edit</u>
WAN 2	Auto	<u>Edit</u>
WAN 3	Auto	<u>Edit</u>
WAN 4	Auto	<u>Edit</u>
WAN 5	Auto	<u>Edit</u>

Bandwidth Configuration

When Auto Load Balance mode is selected, the device will select sessions or IP and the WAN bandwidth will automatically allocate connections to achieve load balancing for external connections. The network bandwidth is set by what users input for it. For example, if the upload bandwidth of both WANs is 512Kbit/sec, the automatic load ratio will be 1:1; if one of the upload bandwidths is 1024Kbit/sec, while the other is 512Kbit/sec, the automatic load ratio will be 2:1. Therefore, to ensure that the device can balance the actual network load, please input real upload and download bandwidths. The section refers to QoS configuration. Therefore, it should be set in QoS page. Please refer to 8.1 QoS bandwidth configuration.

Protocol Binding

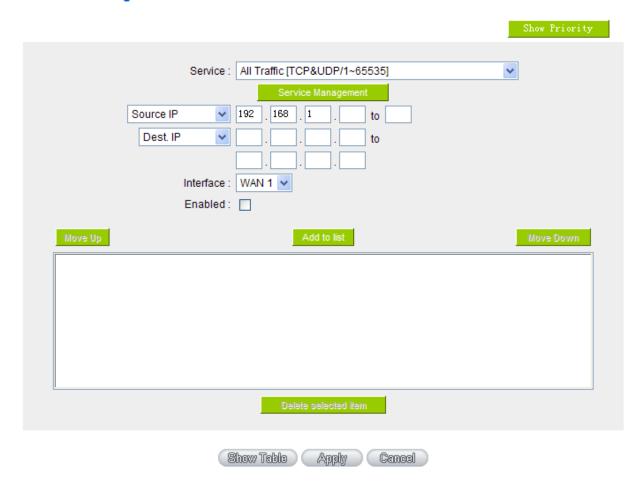

Users can define specific IP addresses or specific application service ports to go through a user-assigned WAN for external connections. For any other unassigned IP addresses and services, WAN load balancing will still be carried out.

Note!

In the load balance mode of Assigned Routing, the first WAN (WAN1) cannot be assigned. It is to be saved for the IP addresses and the application Service Ports that are not assigned to other WANs (WAN2, WAN3, and WAN4) for external connections. In other words, the first WAN (WAN1) cannot be configured with the Protocol Binding rule. This is to avoid a condition where all WANs are assigned to specific Intranet IP or Service Ports and destination IP, no more WAN ports will be available for other IP addresses and Service Ports.

Protocol Binding

Service	This is to select the Binding Service Port to be activated. The default (such as ALL-TCP&UDP 0~65535, WWW 80~80, FTP 21 to 21, etc.) can be selected from the pull-down option list. The default Service is All 0~65535. Option List for Service Management: Click the button to enter the Service Port configuration page to add or remove default Service Ports on the option list.
Source IP	Users can assign packets of specific Intranet virtual IP to go through a specific WAN port for external connection. In the boxes here, input the Intranet virtual IP address range; for example, if 192.168.1.100~150 is input, the binding range will be 100~150. If only specific Service Ports need to be designated, while specific IP designation is not necessary, input "0" in the IP boxes.

Destination IP	In the boxes, input an external static IP address. For example, if connections to destination IP address 210.11.1.1 are to be restricted to WAN1, the external static IP address 210.1.1.1 ~ 210.1.1.1 should be input. If a range of destinations is to be assigned, input the range such as 210.11.1.1 ~ 210.11.255.254. This means the Class B Network Segment of 210.11.x.x will be restricted to a specific WAN. If only specific Service Ports need to be designated, while a specific IP destination assignment is not required, input "0" into the IP boxes.
Interface	Select the WAN for which users want to set up the binding rule.
Enable	To activate the rule.
Add To List	To add this rule to the list.
Delete selected item	To remove the rules selected from the Service List.
Moving Up & Down	The priority for rule execution depends on the rule order in the list. A rule located at the top will be executed prior to those located below it. Users can arrange the order according to their priorities.

Note!

The rules configured in Protocol Binding will be executed by the device according to their priorities too. The higher up on the list, the higher the priority of execution.

Show Priority:

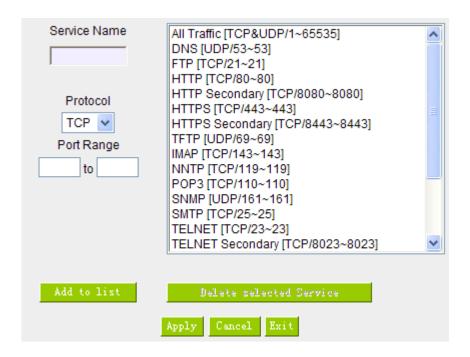

Click the "Show Priority" button. A dialogue box as shown in the following figure will be displayed. Users can choose to sort the list by priority or by interface. Click "Refresh" and the page will be refreshed; click "Close" and the dialogue box will be closed.

Add or Remove Service Port:

If the Service Port users want to activate is not in the list, users can add or remove service ports from "Service Management" to arrange the list, as described in the following:

Service Name	In this box, input the name of the Service Port which users want to activate, such as BT, etc.
Protocol	This option list is for selecting a packet format, such as TCP or UDP for the
	Service Ports users want to activate.
Port range	In the boxes, input the range of Service Ports users want to add.
Add To List	Click the button to add the configuration into the Services List. Users can add
	up to 100 services into the list.
Delete selected Service	To remove the selected activated Services.
Apply	Click the "Apply" button to save the modification.
Cancel	Click the "Cancel" button to cancel the modification. This only works before
	"Apply" is clicked.

Exit	To quit this configuration window.
	4

Auto Load Balancing mode when enabled

The collocation of the Auto Load Balance Mode and the Auto Load Mode will enable more flexible use of bandwidth. Users can assign specific Intranet IP addresses to specific destination application service ports or assign specific destination IP addresses to a WAN users choose for external connections.

Example 1: How do I set up Auto Load Balance Mode to assign the Intranet IP 192.168.1.100 to WAN2 for the Internet?

As in the figure below, select "All Traffic" from the pull-down option list "Service", and then in the boxes of "Source IP" input the source IP address "192.168.1.100" to "100". Retain the original numbers "0.0.0.0" in the boxes of "Destination IP" (which means to include all Internet IP addresses). Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode.

Example 2: How do I set up Auto Load Balance Mode to keep Intranet IP 192.168.1.150 ~ 200 from going through

WAN2 when the destination port is Port 80?

As in the figure below, select "HTTP [TCP/80~80]" from the pull-down option list "Service", and then in the boxes

for "Source IP" input "192.168.1.150" to "200". Retain the original numbers "0.0.0.0" in the boxes of "Destination IP" (which means to include all Internet IP addresses). Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode.

Example 3: How do I set up Auto Load Balance Mode to keep all Intranet IP addresses from going through WAN2 when the destination port is Port 80 and keep all other services from going through WAN1?

As in the figure below, there are two rules to be configured. The first rule: select "HTTP [TCP/80~80]" from the pull-down option list "Service", and then in the boxes of Source IP input "192.168.1.0" to "0" (which means to include all Intranet IP addresses). Retain the original numbers "0.0.0.0" in the boxes of "Destination IP" (Which means to include all Internet IP addresses). Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode. The device will transmit packets to Port 80 through WAN2. However, with only the above rule, packets that do not go to Port 80 may be transmitted through WAN2; therefore, a second rule is necessary. The second rule: Select "All Ports [TCP&UDP/1~65535]" from the pull-down option list "Service", and then input "192.168.1.2 ~ 254" in the boxes of "Source IP". Retain the original numbers "0.0.0.0" in the boxes of "Destination IP" (which means to include all Internet IP addresses). Select WAN1 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode. The device will transmit packets that are not going to Port 80 to the Internet through WAN1.

Configure "Assigned Routing Mode" for Load Balance

IP Group: This function allows users to assign packets from specific Intranet IP addresses or to specific destination Service Ports and to specific destination IP addresses through an assigned WAN to the Internet. After being assigned, the specific WAN will only support those assigned Intranet IP addresses, destination Service Ports, or destination IP addresses. Those which are not configured will go through other WANs for external connection. Only when this mode is collocated with "Assigned Routing" can it bring the function into full play.

Example 1: How do I set up the Assigned Routing Mode to keep all Intranet IP addresses from going through WAN2 when the destination is Port 80, and keep all other services from going through WAN1?

As in the figure below, select "HTTP[TCP/80~80]" from the pull-down option list "Service", and then in the boxes of "Source IP" input "192.168.1.0 ~ 0" (which means to include all Intranet IP addresses). Retain the original numbers "0.0.0.0" in the boxes of "Destination IP" (Which means to include all Internet IP addresses). Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode. After the rule is set up, only packets that go to Port 80 will be transmitted through WAN2, while other traffics will be transmitted through WAN1.

		Show Priority

Example 2: How do I configure Protocol Binding to keep traffic from all Intranet IP addresses from going through

WAN2 when the destinations are IP 211.1.1.1 ~ 211.254.254.254 as well as the whole Class A group of 60.1.1.1 ~

60.254.254.254, while traffic to other destinations goes through WAN1?

As in the following figure, there are two rules to be configured. The first rule: Select "All Port [TCP&UDP/1~65535]" from the pull-down option list "Service", and then in the boxes of "Source IP" input "192.168.1.0 ~ 0" (which means to include all Intranet IP addresses). In the boxes for "Destination IP" input "211.1.1.1 ~ 211.254.254.254". Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New" and the rule will be added to the mode. The second rule: Select "All Port [TCP&UDP/1~65535]" from the pull-down option list "Service", and then in the boxes of "Source IP" input "192.168.1.0 ~ 0" (which means to include all Intranet IP addresses). In the boxes of "Destination IP" input "211.1.1.1 ~ 60,254,254,254". Select WAN2 from the pull-down option list "Interface", and then click "Enable". Finally, click "Add New", and the rule will be added to the mode. After the rule has been set up, all traffic that is not going to the assigned destinations will only be transmitted through WAN1.

VII · Intranet Configuration

This chapter introduces how to configure ports and understand how to configure intranet IP addresses.

7.1 Port Management

Through the GIGABIT Router, users can easily manage the setup for WAN ports, LAN ports and the DMZ port by choosing the number of ports, speed, priority, duplex and enable/disable the auto-negotiation feature for connection setting of each port.

Port Setup

Enable Port 1 as Mirror Port

Port ID	Interface	Disabled	Priority	Speed Status	Duplex Status	Auto Neg.	VLAN
1	LAN		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	VLAN1
2	LAN		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	VLAN1
3	LAN		Normal 🕶	○ 10M ® 100M	O Half @ Full	✓ Enabled	VLAN1
4	LAN		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	VLAN1
5	LAN		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	VLAN1
6	WAN 1		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	
7	WAN 2		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	
8	WAN 3		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	
9	WAN 4		Normal 🕶	○ 10M ⊚ 100M	O Half @ Full	✓ Enabled	
10	WAN 5		Normal 💌	○ 10M ® 100M	O Half @ Full	✓ Enabled	

Disabled	This feature allows users turn on/off the Ethernet port. If selected, the Ethernet port will be shut down immediately and no connection can be made. The default value is "on".
Priority	This feature allows users to set the high/low priority of the packet delivery for the Ethernet port. If it is set as High, the port has the first priority to deliver the packet. The default value is "Normal".
Speed	This feature allows users to select the network hardware connection speed for the Ethernet port. The options are 10Mbps and 100Mbps.

Duplex Status	This feature allows users to select the network hardware connection speed working mode for the Ethernet. The options are full duplex and half duplex.		
Auto Neg.	The Auto-Negotiation mode can enable each port to automatically adjust and gather the connection speed and duplex mode. Therefore, if Enabled Auto-Neg. selected, the ports setup will be done without any manual setting by administrators.		
VLAN	This feature allows administrators to set the LAN port to be one or more disconnected network sessions. All of them will be able to log on to the Internet through the device. Members in the same network session (within the same VLAN) can see and communicate with each other. Members in different VLAN will not know the existence of other members.		
VLAN AII	Set VLAN All port to be the public area of VLAN so that it can be connected to other VLAN networks. A server should be constructed for the intranet so that all VLAN group can visit this server. Set one of the network ports as VLAN All. Connect the server to VLAN All so that computers of different VLAN groups can be connected to this server. Moreover, the port where the administrator locates must be set as VLAN All so that it can be connected to the entire network to facilitate network management.		

Mirror Port: Users can configure LAN 1 as mirror port by choosing "Enable Port 1 as Mirror Port". All the traffic from LAN to WAN will be copied to mirror port. Administrator can control or filter the traffic through mirror port. Once this function is enabled, LAN 1 will be shown as Mirror Port in Physical Port Status, Home page.

Physical Port Status

Port ID	1	2	3	4	5
Interface	Mirror Port	LAN			
Status	Enabled	Connect	Enabled	Enabled	Enabled
Port ID	Internet	Internet	Internet	Internet	Internet
Interface	WAN1	WAN2	WAN3	WAN4	WAN5
Status	Enabled	Enabled	Enabled	Enabled	Connect

7.2 Port Status

This function allows network managers to review the detail information of each port. introduces how to configure ports and understand how to configure intranet IP addresses.

Summary:

There are Network Connection Type, Interface(LAN/WAN1~5/DMZ), Link Status (Up/Down), Port Activity (Port Enabled), Priority Setting (High or Normal), Speed Status (10Mbps/100Mbps/1000Base-T), Duplex Status (half duplex or full duplex), Auto Neg. (Enabled/Disabled), and VLAN(VLAN1~5/VLAN All).

Statistics:

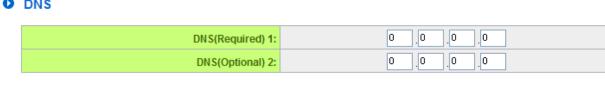

The packet data of this specific port will be displayed. Data include receive/ transmit packet count, receive/ transmit packet Byte count and error packet count. Users may press the refresh button to update all real-time messages.

7.3 IP/ DHCP

With an embedded DHCP server, it supports automatic IP assignation for LAN computers. (This function is similar to the DHCP service in NT servers.) It benefits users by freeing them from the inconvenience of recording and configuring IP addresses for each PC respectively. When a computer is turned on, it will acquire an IP address from the device automatically. This function is to make management easier.

device automatically. This function is to make management easier. ☑ Enabled DHCP Server DHCP Dynamic IP Client Lease Time 1440 Minutes Subnet: Subnet1 Subnet2 Subnet3 Subnet4 **DHCP Server:** Enabled Disabled Disabled Disabled IP Range Start: 192.168.1.100 192.168.2.100 192.168.3.100 192.168.4.100 192.168.1.149 192.168.2.149 192.168.4.149 IP Range End: 192.168.3.149 **MAC Addresses Pool** Pool Table Pool Table for this IP Range: DNS

Dynamic IP:

Client lease Time

This is to set up a lease time for the IP address which is acquired by a PC. The

default is 1440 minutes (a day). Client PC will acquire again after the lease time is expiration. Users can change it according to their needs. The time unit is

minute.

Range Start

This is to set up a lease time for the IP address which is acquired by a PC. The default is 1440 minutes (a day). Users can change it according to their needs.

The time unit is minute.

Range End

This is an initial IP automatically leased by DHCP. It means DHCP will start the

lease from this IP. The default initial IP is 192.168.1.100.

DNS (Domain Name Service):

This is for checking the DNS from which an IP address has been leased to a PC port. Input the IP address of this server directly.

DNS Server (Required) 1

Input the IP address of the DNS server.

DNS Server (Required) 2

Input the IP address of the DNS server.

WINS:

If there is a WIN server in the network, users can input the IP address of that server directly.

WINS Server

Input the IP address of WINS.

Apply

Click "Apply" to save the network configuration modification.

Cancel

Click "Cancel" to leave without making any changes.

Show Table:

This is for the status of showing whole MAC/IP binding list that has configured and you can chose "Edit" to modify it.

IP & MAC binding List	Apply	Select All	Refresh	Close		
IP	MAC	Name		Ena	Enable	
192.168.1.110	2.168.1.110 00:1f:c6:7b:8a:bd			V		

7.4 DHCP Status

This is an indication list of the current status and setup record of the DHCP server. The indications are for the administrator's reference when a network modification is needed.

DHCP Dynamic IP

Client Lease Time 1440 Minutes

DHCP Server:	Enabled	Disabled	Disabled	Disabled
IP Range Start:	192.168.1.100	192.168.2.100	192.168.3.100	192.168.4.100
IP Range End:	192.168.1.149	192.168.2.149	192.168.3.149	192.168.4.149
MAC Addresses Pool for this IP Range:	Pool Table	Pool Table	Pool Table	Pool Table

Unified IP Management

DHCP Server	This is the current DHCP IP.
Dynamic IP Used	The amount of dynamic IP leased by DHCP.
Static IP Used	The amount of static IP assigned by DHCP.
IP Available	The amount of IP still available in the DHCP server.
Total IP	The total IP which the DHCP server is configured to lease.
Host Name	The name of the current computer.
IP Address	The IP address acquired by the current computer.
MAC Address	The actual MAC network location of the current computer.
Client Lease Time	The lease time of the IP released by DHCP.
Delete	Remove a record of an IP lease.

7.5 IP & MAC Binding

Administrators can apply IP & MAC Binding function to make sure that users can not add extra PCs for Internet access or change private IP addresses.

● IP&MAC binding

	Show new IP user
Static IP: MAC Address: Name: Enabled:	
Delete selected item Block MAC address on the list with wrong IP address	
Block MAC address not on the list Apply Cancel	

There are two methods for setting up this function:

Provide services to allowed MAC addresses:

IP & MAC binding

- Block MAC address on the list with wrong IP address
- Block MAC address not on the list

There are two ways to input static IP: 1. If users want to set up a MAC address to acquire IP from DHCP, but the IP need not be a specific assigned IP, input 0.0.0.0 in the boxes. The boxes cannot be left empty. 2. If users want DHCP to assign a static IP for a PC every single time, users should input the IP address users want to assign to this computer in the boxes. The server or PC which is to be bound will then acquire a static virtual IP whenever it restarts.

MAC Address	Input the static real MAC (the address on the network card) for the server or PC which is to be bound.
Name	For distinguishing clients, input the name or address of the client that is to be bound. The maximum acceptable characters are 12.
Enable	Activate this configuration.
Add to list	Add the configuration or modification to the list.
Delete selected Entry	Remove the selected binding from the list.
Add to list	Add new binding.

Block MAC address on the list with wrong IP address: This method only allows MAC addresses on the list to receive IP addresses from DHCP and have Internet access.

Block MAC address not on the list: When this option is activated, MAC addresses which are not included in the list will not be able to connect with the Internet.

Show New IP user:

This function can reduce administrator's effort on checking MAC addresses one by one for the binding. Furthermore, it is easy to make mistakes to fill out MAC addresses on the list manually. By checking this list, administrator can see all MAC addresses which have traffic and are not bound yet. Also, if administrators find that one specific bound MAC address is shown on the list, it means that the user changes the private IP address.

IP & MAC binding List		Apply Select All	Refresh Close
IP	MAC	Name	Enable
192.168.1.110	00:1f:c6:7b:8a:bd		V

Name:	Input the name or address of the client that is to be bound. The maximum acceptable characters are 12.
Enabled:	Choose the item to be bound.
Apply:	Activate the configuration.
Select All:	Choose all items on the list for binding.
Refresh:	Refresh the list.

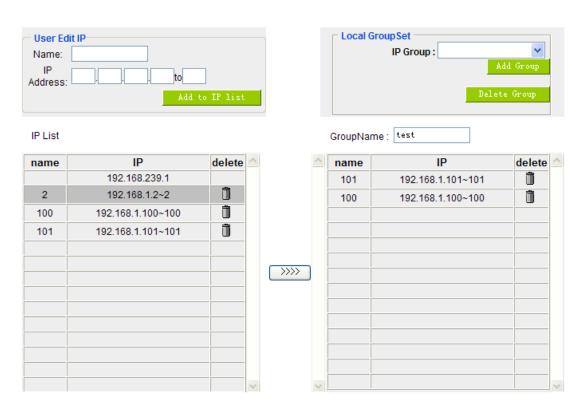

Close:	
	Close the list.

7.6 IP Group Management

IP Group function can combine IP addresses or IP address ranges into several groups. When you manage user internet access privilege by IP address, you can set up every management function for users who have the same internet access privilege in the same IP group in order to decrease the effort of setting rules for each IP address. For example, you can choose to set up QoS or Access Rule by IP grouping. Thus, you will simplify setting rules.

IP Grouping consists of Local IP Group and Remote IP Group. Local IP Group refers to LAN IP groups, and remote IP Group refers to WAN IP groups. Local IP Group list will automatically learn IP addresses having packets that pass through firewall. Moreover, if user changes the IP address, the IP in the list will change accordingly. For IP information which is in the group list, it won't update automatically along with IP list of the left side. Administrators need to modify it manually.

User Edit IP	The IP list will show the list which learns the IP addresses automatically on the left under side. You can also modify IP addresses manually.
Name	Input the name of IP address (or range) showed below.
IP Address	Input IP address (or range). For example, 192.168.1.200 ~ 250.

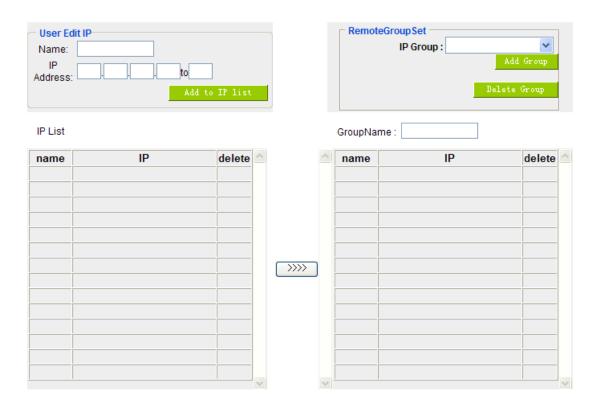

Add to IP List	After setting name and IP address, click this button to add the information into the IP list
	below. If this IP (or range) is already in the list, you need not add it again.
Local Group Set	You can choose from the IP list on the left side to set up a local IP group.
IP Group	Choose IP Group that you would like to modify. If you would like to add new groups, please
	click on "Add new group" button.
Group Name	When you add new groups, please note if the group name is in the column.
Delete Group	Choose the group that you would like to delete from the pull- down list, and click the
	"Delete Group" button. System will ask you again if you would like to delete the group.
	After clicking the confirmation button, the group will be deleted.
button	You can choose several IPs from IP list on the left side, and click this button to have them added into the group the right side.
Delete	Delete self- defined IP or IP range.
Apply	Click "Apply" to save the network configuration modification
Cancel	Click "Cancel" to leave without making any changes.

Remote IP Group Management:

Basically, Remote IP Group setups are exactly the same as Local IP Group setups. However, remote IP group does not have automatically learning functions. Instead, you need to define addresses, ranges and groups manually. For example, 220.130.188.1 to 200 (range).

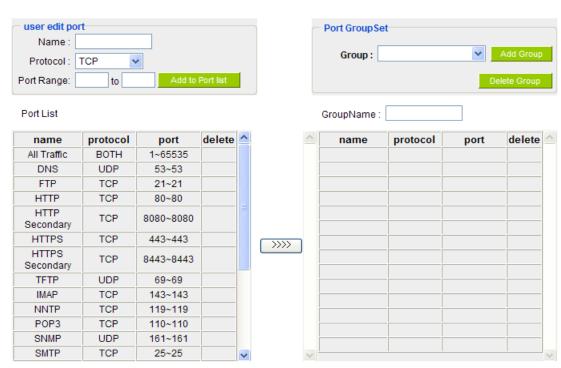

It is the same setting methods. You should set the IP address or the range of remote IP from the left side first, and choose to add IP address information from the left side into the remote group.

7.7 Port Group Management

Service ports can be grouping as IP grouping. It is convenient to set QoS, firewall access rules, and other functions.

User edit port	Input the name, protocol, and port range for the specific service port.
Name	Name the Port in order to identify its property. For example, Virus 135.
Protocol	Choose the port protocol from the pull down list like TCP, UDP or TCP and UDP.
Port Range	Input the port range. For example, 135 to 135.
Add to Port List	After setting name, protocol and port range, click this button to add the information into the Port list below. This port can be from some port groups.
Group Name	When you add new groups, please note if the group name is in the column. For example, Virus.
Delete Group	Choose the group that you would like to delete from the pull- down list, and push the "Delete Group" button. System will ask you again if you would like to delete the group. After clicking the confirmation button, the group will be deleted.

button	You can choose several ports from Port list on the left side, and push this button to have them added into the group the right side.
Delete	Delete self- defined port or port range.
Apply	Click "Apply" to save the network configuration modification
Cancel	Click "Cancel" to leave without making any changes.

VIII. QoS (Quality of Service)

QoS is an abbreviation for Quality of Service. The main function is to restrict bandwidth usage for some services and IP addresses to save bandwidth or provide priority to specific applications or services, and also to enable other users to share bandwidth, as well as to ensure stable and reliable network transmission. To maximize the bandwidth efficiency, network administrators should take account of the practical requirements of a company, a community, a building, or a café, etc., and modify bandwidth management according to the network environment, application processes or services.

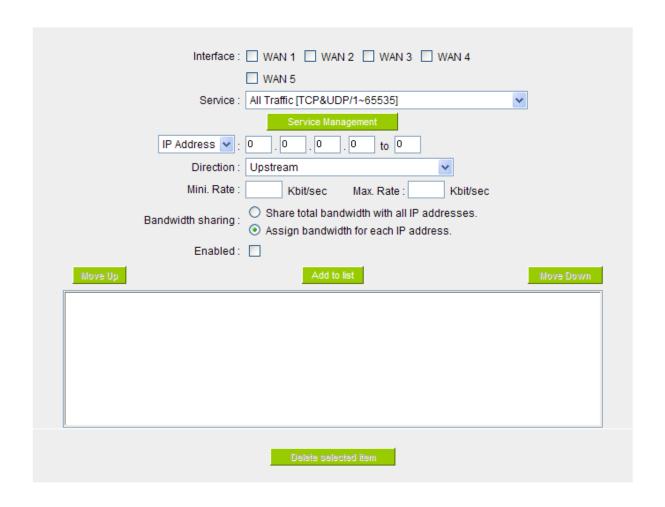

8.1 Bandwidth Management (QoS)

• The Maximum Bandwidth provided by ISP

Interface	Upstream (Kbit/sec)	Downstream (Kbit/sec)
WAN 1	10000	10000
WAN 2	10000	10000
WAN 3	10000	10000
WAN 4	10000	10000
WAN 5	10000	10000

Quality of Service

8.1.1 Bandwidth Management

The Maximum Bandwidth provided by ISP

Interface	Upstream (Kbit/sec)	Downstream (Kbit/sec)
WAN 1	10000	10000
WAN 2	10000	10000
WAN 3	10000	10000
WAN 4	10000	10000
WAN 5	10000	10000

In the boxes for WAN1 and WAN2 bandwidth, input the upstream and downstream bandwidth which users applied for from bandwidth supplier. The bandwidth QoS will make calculations according to the data users input. In other words, it will guarantee a minimum rate of upstream and downstream for each IP and Service Port based on the total actual bandwidth of WAN1 and WAN2. For example, if the upstream bandwidths of both WAN1 and WAN2 are 512Kbit/Sec, the total upstream bandwidth will be: WAN1 + WAN2 = 1024Kbit/Sec. Therefore, if there are 50 IP addresses in the Intranet, the minimum guaranteed upstream bandwidth for each IP would be 1024Kbit/50=20Kbit/Sec. Thus, 20Kbit/Sec can be input for "Mini. Rate" Downstream bandwidth can be calculated in the same way.

Note!

The unit of calculation in this example is Kbit. Some software indicates the downstream/upstream speed with the unit KB. 1KB = 8Kbit.

8.1.2 QoS

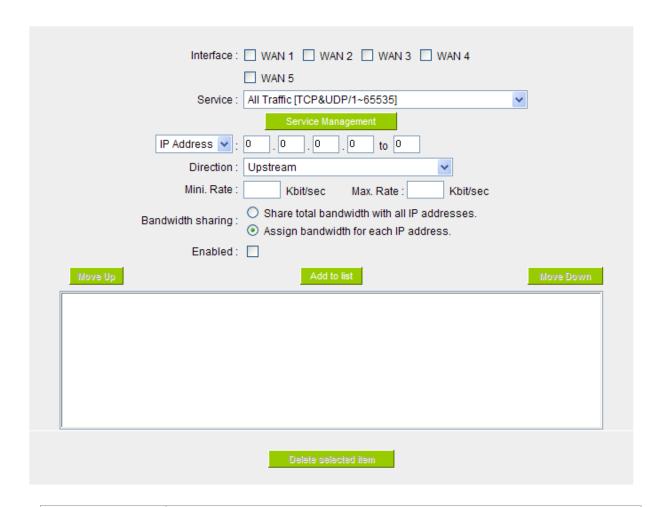

To satisfy the bandwidth requirements of certain users, the device enables users to set up QoS: Rate Control and Priority Control. Users can select only one of the above QoS choices.

Rate Control:

The network administrator can set up bandwidth or usage limitations for each IP or IP range according to the actual bandwidth. The network administrator can also set bandwidth control for certain Service Ports. A guarantee bandwidth control for external connections can also be configured if there is an internal server.

Quality of Service

Interface	Select on which WAN the QoS rule should be executed. It can be a single selection or multiple selections.
Service	Select what bandwidth control is to be configured in the QoS rule. If the bandwidth for all services of each IP is to be controlled, select "All (TCP&UDP) 1~65535". If only FTP uploads or downloads need to be controlled, select "FTP Port 21~21". Refer to the Default Service Port Number List.
IP Address	This is to select which user is to be controlled. If only a single IP is to be restricted, input this IP address, such as "192.168.1.100 to 100". The rule will control only the IP 192.168.1.100. If an IP range is to be controlled, input the range, such as "192.168.1.100 $^{\sim}$ 150". The rule will control IP addresses from 192.168.1.100 to 150. If all Intranet users that connect with the device are to be controlled, input "0" in the

	boxes of IP address. This means all Intranet IP addresses will be restricted. QoS can
	also control the range of Class B.
Direction	also control the range of class b.
Direction	Upstream: Means the upload bandwidth for Intranet IP.
	Downstream: Means the download bandwidth for Intranet IP.
	Server in LAN, Upstream: If a Server for external connection has been built in the device, this option is to control the bandwidth for the traffic coming from outside to this Server.
	Server in LAN, Downstream: If there are web sites built in the Intranet, this option is to control the upload bandwidth for the connections from outside to this Server. For example, game servers have been built in many Internet cafés. This rule can be used to control the bandwidth for connections from outside to the game server of a café to update data. In this way, game players inside the café will not be affected.
Min. & Max. Rate (Kbit/Sec)	The minimum bandwidth: The rule is to guarantee minimum available bandwidth.
	The maximum bandwidth: This rule is to restrict maximum available bandwidth. The maximum bandwidth will not exceed the limit set up under this rule.
	Attention! The unit of calculation used in this rule is Kbit. Some software indicates download/upload speed by the unit KB. 1KB = 8Kbit.
Bandwidth Sharing	Sharing total bandwidth with all IP addresses: If this option is selected, all IP addresses or Service Ports will share the bandwidth range (from minimum to maximum bandwidth).
	Assign bandwidth for each IP address: If this option is selected, every IP or Service Port in this range can have this bandwidth (minimum to maximum.). For example, If the rule is set for the IP of each PC, the IP of each PC will have the same bandwidth. Note!
	If "Share-Bandwidth" is selected, be aware of the actual usage conditions and avoid an improper configuration that might cause a malfunction of the network when the bandwidth is too small. For example, if users do not want an FTP to occupy too much bandwidth, users can select the "Share-Bandwidth Mode", so that no matter how much users use FTPs to download information, the total occupied bandwidth is fixed.

Enabled	Activate the rule.
Add to list	Add this rule to the list.
Move up & down	QoS rules will be executed from the bottom of the list to the top of the list. In other words, the lower down the list, the higher the priority of execution. Users can arrange the sequence according to their priorities. Usually the service ports which need to be restricted, such as BT, e-mule, etc., will be moved to the bottom of the list. The rules for certain IP addresses would then be moved upward.
Delete selected items	Remove the rules selected from the Service List.
Show Table	Display all the Rate Control Rules users made for the bandwidth. Click "Edit" to modify.
Apply	Click "Apply" to save the configuration
Cancel	Click "Cancel" to leave without making any change.

Show Table:

Click "Show Table" button, you can get a window as below. You can select "Rule" to display rules, or select Interface to display rules. Click update can re-flash window. Click "Close" can close this window. You can also click "Edit" to modify parameters.

8.1.3 Smart QoS

With Smart QoS, you can reach the traffic management without setup IP addresses in the traffic management rule. This function detects LAN users automatically, fewer LAN users can use higher bandwidth, and too many LAN users can use user lower bandwidth, so that all LAN users can use bandwidth at average. This function is flexible and simplifies the management effort.

✓ Enabled Smart Qos

When the utility of any wan's bandwith is over than ⁶⁰ %, Enable Smart Qos(0: Always Enabled)		
☑ Each IP's upst	tream bandwidth threshold : 500 Kbit/sec	
✓ Each IP's downstream bandwidth threshold : 1000 Kbit/sec		
Each IP's Maximu	m bandwith:	
Upstream	(WAN 1 : 200 Kbit/sec WAN 2 : 200 Kbit/sec WAN 3 : 200 Kbit/sec	
	WAN 4 : 200 Kbit/sec WAN 5 : 200 Kbit/sec)	
Downstream	(WAN 1: 400 Kbit/sec WAN 2: 400 Kbit/sec WAN 3: 400 Kbit/sec	
	WAN 4: 400 Kbit/sec WAN 5: 400 Kbit/sec)	
Penalty mechanism		
Show Panelty IP		

Enable Smart QoS Click Enable Intelligent QoS When the utility of any WAN's When the bandwidth usage is over the condition, the dynamic bandwidth is over _%, Enable intelligent QoS will auto start. The default condition is 60%. **Smart QoS** (0: Always Enabled) Each IP's upstream bandwidth Setup the Upstream bandwidth threshold. threshold Each IP's downstream bandwidth Setup the Downstream bandwidth threshold. threshold Each IP's maximum bandwidth When an IP address usage over above upstream or downstream thresholds, the penalty is triggered. Please setup penalty upstream / downstream bandwidth. Penalty mechanism Select the second penalty, if one user triggered the internal condition, this user will has a second penalty. **Show Penalty IP** Display penalty IP addresses, upstream limit, downstream limit and second penalty information.

8.1.4 Bandwidth Management Scheduling

You can use Time Schemer function to deploy difference traffic management scripts in difference time, so that we can use maximum bandwidth efficiency.

Enable Bandwidth Management	Enable Bandwidth Management Scheduling	
Scheduling		
Date	From Sunday to Saturday	
Schedule	We have three time ranges can setup in one day, and the clock	
	formula is 24H. If you select "All day" in the first time range, then	
	others time range will blank and unable to setup. The time ranges	
	can't overlap. We have "shutdown", QoS and Smart QoS methods	
	can be used.	
Beside schedule	Other unspecified time, we still can deploy "shutdown", "QoS" or "Smart QoS" methods for traffic management.	
Annh	onare des meners es trans management.	
Apply	Click "Apply" button to saving configuration.	
Cancel	Click "Cancel" button to reject modification.	

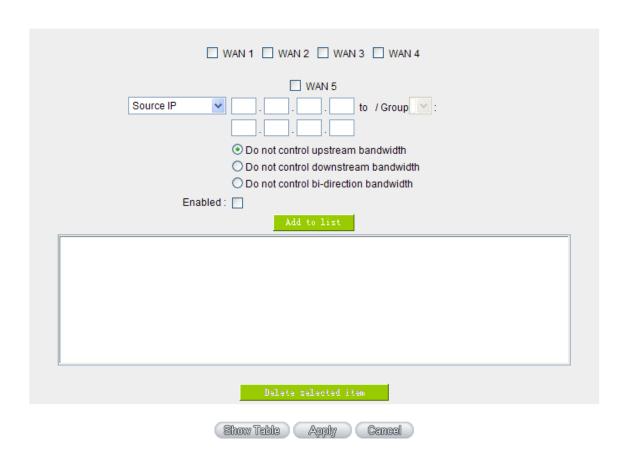

Close

Click "Close" button to leaving this configuration page without saving.

8.1.5 Exception IP address

If some users are allowed to avoid traffic management control, you can use this function to fulfill the requirement.

Exception IP address

WAN

Select WAN ports.

Source IP

Enter the exempted IP range, or select the exempted IP group.

Do not control

Select do not control upload, download, or both of them.

Direction Enabled

Enable this policy.

Add to List

Add this policy into the exempted list.

Delete Selected

Delete selected list.

item Apply

Click "Apply" button to saving configuration.

Cancel

Click "Cancel" button to reject modification.

8.2 Session control

Session management controls the acceptable maximum simultaneous sessions of Intranet PCs. This function is very useful for managing connection quantity when P2P software such as BT, Thunder, or emule is used in the Intranet causing large numbers of sessions. Setting up proper limitations on sessions can effectively control the sessions created by P2P software. It will also have a limiting effect on bandwidth usage.

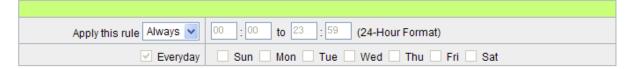

In addition, if any Intranet PC is attacked by a virus like Worm.Blaster and sends a huge number of session requests, session control will restrict that as well.

Session Control and Scheduling:

Session Control

Disabled	
O Single IP cannot exceed 200 Session	
O When single IP exceed 200 Session	O block this IP's new sessions for 5 minutes
	O block this IP's all sessions for 5 minutes

Scheduling

Disabled	Disable Session Control function.
Single IP cannot exceed _ session	This option enables the restriction of maximum external sessions to each Intranet PC. When the number of external sessions reaches the limit, to allow new sessions to be built, some of the existing sessions must be closed. For example, when BT or P2P is being used to download information and the sessions exceed the limit, the user will be unable to connect with other services until either BT or P2P is closed.
When single IP exceed _ session	block this IP to add new session for Minutes

	If this function is selected, when the user's port session reach the limit, this user will not be able to make a new session for five minutes. Even if the previous session has been closed, new sessions cannot be made until the setting time	
	ends.	
	O block this IP's all connection for 5 Minutes	
	If this function is selected, when the user's port connections reach the limit, all	
	the lines that this user is connected with will be removed, and the user will not	
	be able to connect with the Internet for five minutes. New connections cannot be	
	made until the delay time ends.	
Scheduling	If "Always" is selected, the rule will be executed around the clock.	
	If "From" is selected, the rule will be executed according to the configured time	
	range. For example, if the time control is from Monday to Friday, 8:00am to	
	6:00pm, users can refer to the following figure to set up the rule.	
Apply	Click "Apply" to save the configuration.	
Cancel	Click "Cancel" to leave without making any change.	

Exempted Service Port or IP Address

Some IP addresses or specified services should be free in a environment, for example: SMTP service, you can use this function to avoid the session control.

Exempted Service Port or IP Address

Service	Choose the service port.
IP Address	Input the IP address range or IP group.
Enabled	Activate the rule.
Add to list	Add this rule to the list.
Delete selected	Remove the rules selected from the Service List.
Apply	Click "Apply" to save the configuration.
Cancel	Click "Cancel" to leave without making any change.

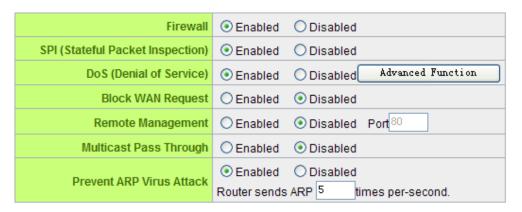

IX. Firewall

This chapter introduces firewall general policy, access rule, and content filter settings to ensure network security.

9.1 General Policy

The firewall is enabled by default. If the firewall is set as disabled, features such as SPI, DoS, and outbound packet responses will be turned off automatically. Meanwhile, the remote management feature will be activated. The network access rules and content filter will be turned off.

General Policy

Firewall	This feature allows users to turn on/off the firewall.	
SPI (Stateful Packet Inspection)	This enables the packet automatic authentication detection technology. The Firewall operates mainly at the network layer. By executing the dynamic authentication for each connection, it will also perform an alarming function for application procedure. Meanwhile, the packet authentication firewall may decline the connections which use non-standard communication protocol.	
DoS (Denial of Service)	This averts DoS attacks such as SYN Flooding, Smurf, LAND, Ping of Death, IP Spoofing and so on.	
Block WAN Request	If set as Enabled, then it will shut down outbound ICMP and abnormal packet	

	responses in connection. If users try to ping the WAN IP from the external, this will not work because the default value is set as activated in order to decline the outbound responses.
Remote Management	To enter the device web- based UI by connecting to the remote Internet, this feature must be activated. In the field of remote browser IP, a valid external IP address (WAN IP) for the device should be filled in and the modifiable default control port should be adjusted (the default is set to 80, modifiable).
Multicast Pass Through	There are many audio and visual streaming media on the network. Broadcasting may allow the client end to receive this type of packet message format. This feature is off by default.
Prevent ARP Virus Attack	This feature is designed to prevent the intranet from being attacked by ARP spoofing, causing the connection failure of the PC. This ARP virus cheat mostly occurs in Internet cafes. When attacked, all the online computers disconnect immediately or some computers fail to go online. Activating this feature may prevent the attack by this type of virus.

Advance DoS Settings

Packet Type	WAN Threshold		LAN Threshold

Advanced Function

Packet Type: This device provides three types of data packet transmission: TCP-SYN-Flood, UDP-Flood and ICMP-Flood.

WAN Threshold: When all packet values from external attack or from single external IP attack reach the maximum amount (the default is 15000 packets/Sec and 2000 packets/Sec respectively), if these conditions above occurs, the IP will be blocked for 5 minutes (the default is 5 minutes OBJ 176). Users can adjust the threshold value and the blocking duration to effectively deal with external attack. The threshold value should be adjusted from high to low.

LAN Threshold: When all packet values from internal attack or from single internal IP attack reach the maximum amount (the default is 15000 packets/Sec and 2000 packets/Sec respectively), if these conditions above occurs, the IP will be blocked for 5 minutes (the default is 5 minutes). Users can adjust the threshold value and the

	blocking duration to effectively deal with external attack. The threshold value should be adjusted from high to low.	
Exception Source IP	Input the exempted source IP.	
Exception Dest. IP	Input the exempted Destination IP addresses.	
Apply	Click "Apply" to save the configuration.	
Cancel	Click "Cancel" to leave without making any change.	

Restrict Application

Exception ip address

Apply Cancel

Special service
Choose the blocked service application.

Exception IP	Add the IPs which are not required for blocking.
Add to list	Add this rule to the list.
Delete selected item	Remove the rules selected from the Service List.

9.2 Access Rule

Users may turn on/off the setting to permit or forbid any packet to access internet. Users may select to set different network access rules: from internal to external or from external to internal. Users may set different packets for IP address and communication port numbers to filter Internet access rules.

Network access rule follows IP address, destination IP address, and IP communications protocol status to manage the network packet traffic and make sure whether their access is allowed by the firewall.

9.2.1 Default Access Rule

The device has a user-friendly network access regulatory tool. Users may define network access rules. They can select to enable/ disable the network so as to protect all internet access. The following describes the internet access rules:

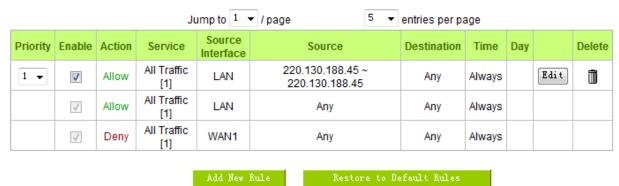

- All traffic from the LAN to the WAN is allowed by default.
- All traffic from the WAN to the LAN is denied by default.
- All traffic from the LAN to the DMZ is allowed by default.
- All traffic from the DMZ to the LAN is denied by default.
- All traffic from the WAN to the DMZ is allowed by default.
- All traffic from the DMZ to the WAN is allowed by default.

Users may define access rules and do more than the default rules. However, the following four extra service items are always on and are not affected by other user-defined settings.

- * HTTP Service (from LAN to Device) is on by default (for management)
- * DHCP Service (from LAN to Device) is set to on by default (for the automatic IP retrieval)
- * DNS Service (from LAN to Device) is on by default (for DNS service analysis)
- * Ping Service (from LAN to Device) is on by default (for connection and test)

Access Rule

In addition to the default rules, all the network access rules will be displayed as illustrated above. Users may follow or self- define the priority of each network access rule. The device will follow the rule priorities one by one, so please make sure the priority for all the rules can suit the setting rules.

Edit

Define the network access rule item

Delete

Remove the item.

Add New Rule

Create a new network access rule

Return to Default

Rule

Restore all settings to the default values and delete all the self-defined settings.

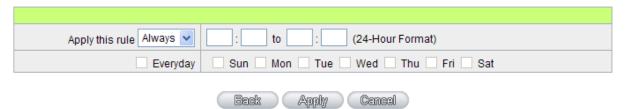

9.2.2 Add New Access Rule

Service

Action:	Allow 💌		
Service:	All Traffic [TCP&UDP/1~65535] Service Management		
Log:	No log 💌		
Source Interface :	LAN 💌		
Source I	Source IP: ANY		
Dest. I	2: ANY		

Scheduling

Action	Allow: Permits the pass of packets compliant with this control rule
	Deny: Prevents the pass of packets not compliant with this control rule
Service	From the drop-down menu, select the service that users grant or do not give permission.
Service Management	If the service that users wish to manage does not exist in the drop-down menu, press – Service Management to add the new service. From the pop-up window, enter a service name and communications protocol and port, and then click the "Add to list" button to add the new service.
Log	No Log: There will be no log record. Create Log when matched: Event will be recorded in the log.
Source Interface	Select the source port whether users are permitted or not (for example: LAN, WAN1, WAN2 or Any). Select from the drop-down menu.

Source IP	Select the source IP range (for example: Any, Single, Range, or preset IP group
	name). If Single or Range is selected, please enter a single IP address or an IP
	address within a session.
Dest. IP	Colort the destination ID was a law Circle Dance on week ID was a
	Select the destination IP range (such as Any, Single, Range, or preset IP group
	name) If Single or Range is selected; please enter a single IP address or an IP
	address within a session.
Scheduling	Select "Always" to apply the rule on a round-the-clock basis. Select "from", and
	the operation will run according to the defined time.
Apply this rule	Select "Always" to apply the rule on a round-the-clock basis.
	If "From" is selected, the activation time is introduced as below
to	This control rule has time limitation. The setting method is in 24-hour format,
	_
	such as 08:00 ~ 18:00 (8 a.m. to 6 p.m.)
Day Control	"Everyday" means this period of time will be under control everyday. If users only
	certain days of a week should be under control, users may select the desired days
	directly.
Apply	Click "Apply" to save the configuration.
Cancel	Click "Cancel" to leave without making any change.

Example1: How to block TCP 135-139 ports

First, add a new TCP 135-139 service port object(please refer the service port chapter), and the finish below configurations.

Action: Deny

Service: TCP135-139

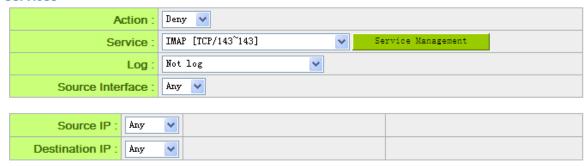

Source Interface: Any

Source IP address: Any

Destination IP address: Any

Services

Example2: How to block LAN IP addresses from 192.168.1.200-192.168.1.230 to access the TCP 80 port?

Action: Deny

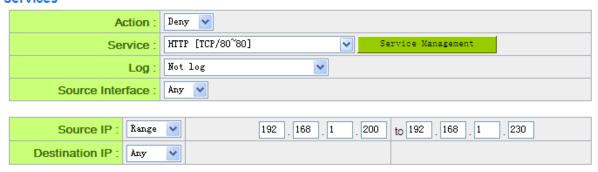

Service: TCP 80

Source Interface: Range

Source IP address: range from 192.168.1.200 to 192.168.1.230

Destination address: Any

Services

9.3 Content Filter

The GIGABIT Router supports two webpage restriction modes: one is to block certain forbidden domains, and the other is to give access to certain web pages. Only one of these two modes can be selected.

O	Block Forbidden Domains Accept Allowed Domains
	Forbidden Domains Enabled Enable Website Blocking by Keywords
0	Scheduling
	Apply this rule Always Oo : Oo to Oo : Oo (24-Hour Format) Everyday Sun Mon Tue Wed Thu Fri Sat
	Apply Cancel

Block Forbidden Domain:

Fill in the complete website such as www.sex.com to have it blocked.

- Block Forbidden Domains
- Accept Allowed Domains

Forbidden Domains

Forbidden Domains Enabled

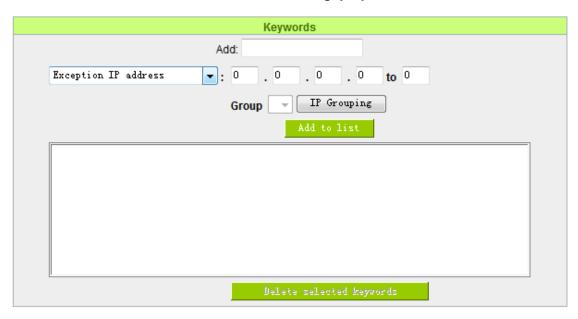

Forbidden Domains Enabled	Click to enable the forbidden domains function. Default is Disabled.
Add	Input the website to be controlled. For example, www.playboy.com
Exception IP Address	Input the IP or IP ranges not to be controlled.
Add to list	Click "Add to list" to create a new website to be controlled.
Delete selected domain	Click to select one or more controlled websites and click this option to delete.
Apply	Click "Apply" to save the configuration.
Cancel	Click "Cancel" to leave without making any change.

Website Blocking by Keywords:

Website Blocking by Keywords

Enable Website Blocking by Keywords

Enable Website Blocking by Keywords	Click to activate this feature. The default setting is disabled. For example: If users enter the string "sex", any websites containing "sex" will be blocked.
Add	Enter keywords. Only for English keyword.
Exception IP address	Input the IP or IP ranges not to be controlled.
Add to List	Add this new service item content to the list.
Delete selected	Delete the service item content from the list
Apply	Click "Apply" to save the modified parameters.
Cancel	Click "Cancel" to cancel all the changes made to the parameters.

Accept Allowed Domains:

In some companies or schools, employees and students are only allowed to access some specific websites. This is the purpose of the function.

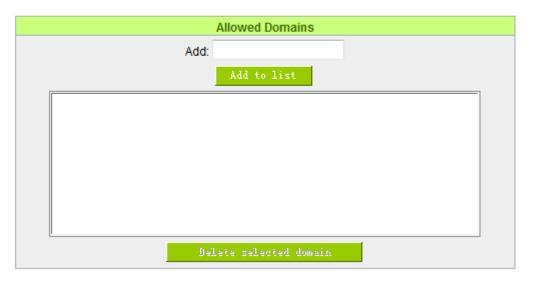

Select "Accept Allowed Domains" check box, you will see below setup windows:

- Block Forbidden Domains
- Accept Allowed Domains

Allowed Domains

Allowed Domains Enabled

Allowed Domains Enabled	Activate the function. The default setting is "Disabled."
Add	Input the allowed domain name, etc. www.google.com
Add to list	Add the rule to list.
Delete selected item	Users can select one or more rules and click to delete.
Apply	Click "Apply" to save the modified parameters.
Cancel	Click "Cancel" to cancel all the changes made to the parameters.

Exception IP address:

You can exempted some IP addresses or IP group from the "Allow Domain".

Exception

Exception IP address/Group

Enter the exempted IP addresses or IP group.

Add to list

Click this button to add exempted IP addresses or IP group.

Delete selected range

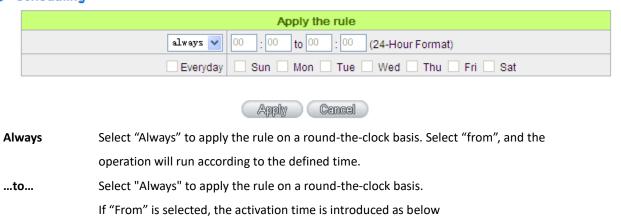

Click this button to delete selected exempted IP address or IP group.

Content Filter Scheduling:

Select "Always" to apply the rule on a round-the-clock basis. Select "from", and the operation will run according to the defined time. For example, if the control time runs from 8 a.m. to 6 p.m., Monday to Friday, users may control the operation according to the following illustrated example.

Scheduling

Day Control

This control rule has time limitation. The setting method is in 24-hour format, such as 08:00

~ 18:00 (8 a.m. to 6 p.m.)

X. VPN (Virtual Private Network)

10.1. VPN

10.1.1. Display All VPN Summary

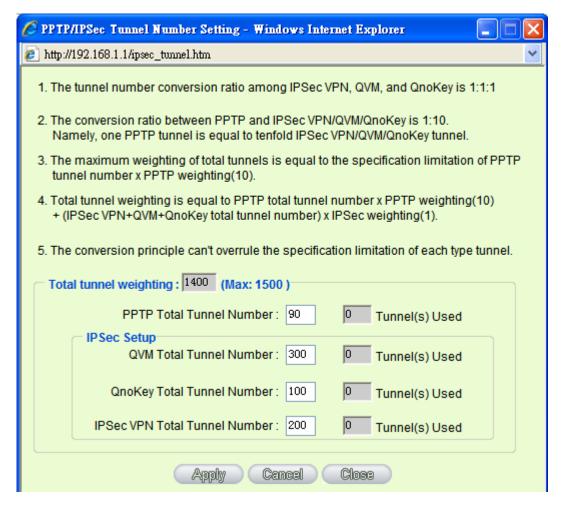

This VPN Summary displays the real-time data with regard to VPN status. These data include: all tunnel numbers (PPTP, IPSec + QnoKey and IPSec VPN), setting parameters and Group VPN and so forth.

Advanced Setting: Through Advanced setting, users may adjust the tunnel number of IPSec and QnoKey.

This shows how many VPN tunnels are in use or available.

Detail: Push this button to display the following information with regard to all current VPN configurations to facilitate VPN connection management.

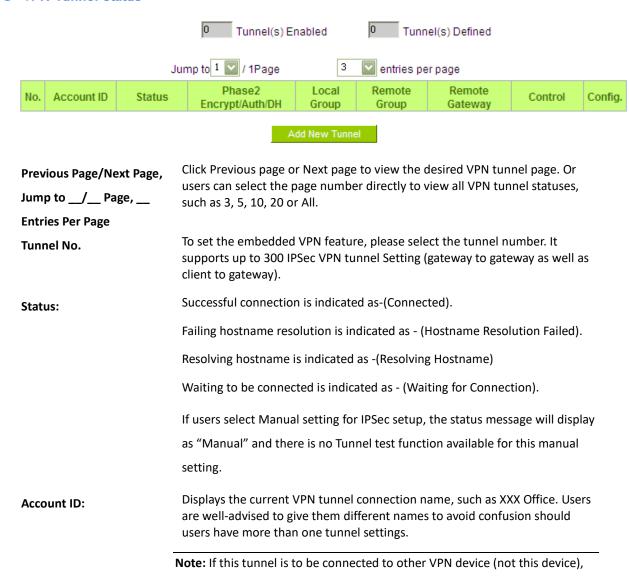

VPN Tunnel Status:

The following describes VPN Tunnel Status, the current status of VPN tunnel in detail:

VPN Tunnel Status

some device requires that the tunnel name is identical to the name of the host end to facilitate verification. This tunnel can thus be successfully

enabled.

Phase2 Displays settings such as encryption (DES/3DES), authentication (MD5/SHA1)

Encrypt/Auth/Group: and Group (1/2/5).

If users select Manual setting for IPSec, Phase 2 DH group will not display.

Local Group: Displays the setting for VPN connection secure group of the local end.

Remote Group: Displays the setting for remote VPN connection secure group.

Remote Gateway: Set the IP address to connect the remote VPN device. Please set the VPN

device with a valid IP address or domain name.

Control: Click "Connect" to verify the tunnel status. The test result will be updated.

To disconnect, click "Disconnect" to stop the VPN connection.

Config: Setting items include Edit and Delete icon.

Click on **Edit** to enter the setting items and users may change the settings.

Click on the trash bin icon and all the tunnel settings will be deleted.

____Tunnel(s) Enabled: This displays how many tunnels are enabled and how many tunnels are set.

__ Tunnel(s) Defined:

VPN Group Tunnel Status: (Future)

If there is no setting for Group VPN, there will be no display of VPN Group status.

O VPN Group Tunnel Status

Group Name	Connected Tunnels	Phase2 Encrypt/Auth/DH	Local Group	Remote Client	Remote Client Status	Control	Config.
------------	----------------------	---------------------------	----------------	------------------	-------------------------	---------	---------

Group Name: Displays the tunnel name of the Group VPN that is connected.

Connected Tunnels: Displays the VPN Groups tunnel numbers.

Phase2 Encrypt/Auth/DH: Displays settings such as encryption (DES/3DES), authentication (MD5/SHA1) and

Group (1/2/5).

If users select Manual setting for IPSec, Phase 2 DH group will not be displayed.

Local Group: Displays the VPN connection secure setting for the local group.

Remote Client: Displays the name of this group for remote VPN Connection secure group setting.

Remote Client Status: Click on Detail List, and more information such as Group Name, IP address and

the connection time will be displayed.

Control: Click Connect to verify the status of the tunnel. The test result will be updated in

this status.

Config: As illustrated below, configurations include Edit and Delete icon. Click on Edit

the tunnel settings will be deleted.

10.1.2. Add a New VPN Tunnel

The device supports Gateway to Gateway tunnel or Client to Gateway tunnel.

The VPN tunnel connections are done by 2 VPN devices via the Internet. When a new tunnel is added, the setting page for Gateway to Gateway or Client to Gateway will be displayed.

Gateway to Gateway:

Click "Add" to enter the setting page of Gateway to Gateway.

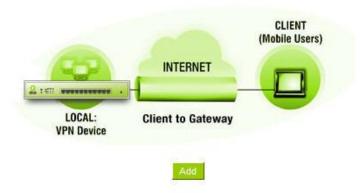

Client to Gateway:

Click "Add" to enter the setting page of Client to Gateway.

O Client to Gateway

10.1.2.1. Gateway to Gateway Setting

Tunnel No.	1
Tunnel Name:	
Interface:	WAN 1 🔀
Enabled:	

The following instructions will guide users to set a VPN tunnel between two devices.

Tunnel No.: Set the embedded VPN feature, please select the Tunnel number.

Tunnel Name: Displays the current VPN tunnel connection name, such as XXX Office. Users are

well-advised to give them different names to avoid confusion.

Note: If this tunnel is to be connected to the other VPN device, some device requires that the tunnel name is identical to the name of the host end to facilitate verification.

This tunnel can thus be successfully enabled.

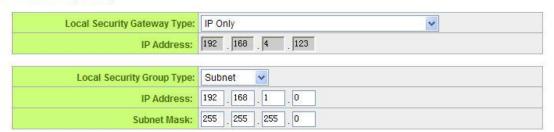

Interface: From the pull-down menu, users can select the Interface for this VPN tunnel.

Enabled: Click to activate the VPN tunnel. This option is set to activate by default. Afterwards,

users may select to activate this tunnel feature.

Local Group Setup:

Local Group Setup

This Local Security Gateway Type must be identical with that of the remote type (Remote Security Gateway Type).

Local Security Gateway Type: This local gateway authentication type comes with five operation modes,

which are:

IP only IP + Domain Name (FQDN) Authentication

IP + E-mail Addr. (USER FQDN) Authentication Dynamic IP + Domain Name (FQDN) Authentication

Dynamic IP + E-mail Addr. (USER FQDN) Authentication. Dynamic IP address + Email address name

(1) IP only:

If users decide to use **IP only**, entering the IP address is the only way to gain access to this tunnel. The WAN IP address will be automatically filled into this space. Users don't need to do further settings.

(2) IP + Domain Name(FQDN) Authentication:

If users select IP + domain name type, please enter the domain name and IP address. The WAN IP address will be automatically filled into this space. Users don't need to do further settings. FQDN refers to the combination of host name and domain name and can be retrieved from the Internet, i.e. vpn.server.com. This IP address and domain name must be identical to those of the VPN secure gateway setting type to establish successful connection.

(3) IP + E-mail Addr. (USER FQDN) Authentication.

If users select IP address and E-mail, enter the IP address and E-mail address to gain access to this tunnel and the WAN IP address will be automatically filled into this space. Users don't need to do further settings.

(4) Dynamic IP + Domain Name(FQDN) Authentication:

If users use dynamic IP address to connect to the device, users may select this option to link to VPN. If the remote VPN gateway requires connection

to the device for VPN connection, this device will start authentication and respond to this VPN tunnel connection; if users select this option to link to VPN, please enter the domain name.

(5) Dynamic IP + E-mail Addr. (USER FQDN) Authentication.

If users use dynamic IP address to connect to the device, users may select this option to connect to VPN without entering IP address. When VPN Gateway requires for VPN connection, the device will start authentication and respond to VPN tunnel connection; If users select this option to link to VPN, enter E-Mail address to the empty field for E-Mail authentication.

Local Security Group Type:

This option allows users to set the local VPN connection access type. The following offers a few items for local settings. Please select and set appropriate parameters:

1. IP address

This option allows the only IP address which is entered to build the VPN tunnel.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.1.0 can establish connection.

2. Subnet

This option allows local computers in this subnet can be connected to the VPN tunnel.

Reference: When this VPN tunnel is connected, only computers with the

session of 192.168.1.0 and with subnet mask as 255.255.255.0 can connect with remote VPN.

3. IP Range

This option allows connection only when IP address range which is entered after the VPN tunnel is connected.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.1.0 $^{\sim}$ 254 can establish connection.

Remote Group Setup:

Remote Group Setup

Remote Security Gateway Type:	IP Only
IP Address	
Remote Security Group Type:	Subnet
IP Address:	
Subnet Mask:	255 255 255 0

This remote gateway authentication type (Remote Security Gateway Type) must be identical to the remotely-connected local security gateway authentication type (Local Security Gateway Type).

Remote Security Gateway

Type:

This remote gateway authentication type comes with five operation modes, which are:

IP only-Authentication by use of IP only

IP + Domain Name (FQDN) Authentication, -IP + Domain name

IP + E-mail Addr. (USER FQDN) Authentication, -IP + Email address

Dynamic IP + Domain Name (FQDN) Authentication, -Dynamic IP address

+ Domain name

Dynamic IP + E-mail Addr. (USER FQDN) Authentication. Dynamic IP address + Email address name

(1) IP only:

If users select the IP Only type, entering this IP allows users to gain access to this tunnel.

If the IP address of the remote client is unknown, choose IP by DNS Resolved, allowing DNS to translate IP address. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

Or users can choose IP by Multiple DNS Resolved, and IP address can be translated through DNS. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

(2) IP + Domain Name(FQDN) Authentication:

If users select IP + domain name, please enter IP address and the domain name to be verified. FQDN refers to the combination of host name and domain name. Users may enter any name that corresponds to the domain name of FQDN. This IP address and domain name must be identical to those of the remote VPN security gateway setting type to establish successful connection.

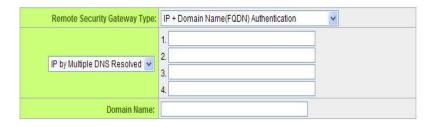

If the remote IP address is unknown, choose IP by DNS Resolved, allowing DNS to translate the IP address. This domain name must be available on the Internet. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

Or users can choose IP by Multiple DNS Resolved, and IP address can be translated through DNS. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

(3) IP + E-mail Addr. (USER FQDN) Authentication:

If users select IP address and E-mail type, entering the IP address and the E-mail allows users to gain access to this tunnel.

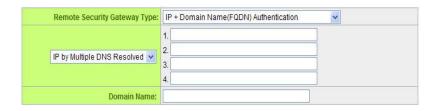

If the remote IP address is unknown, choose IP by DNS Resolved, allowing DNS to translated the IP address. This domain name must be available on the Internet. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

Or users can choose IP by Multiple DNS Resolved, and IP address can be translated through DNS. When users finish the setting, the corresponding IP address will be displayed under the remote gateway of Summary.

(4) Dynamic IP + Domain Name(FQDN) Authentication:

If users use dynamic IP address to connect with the device, users may select the combination of the dynamic IP address, host name and domain name.

(5) Dynamic IP + E-mail Addr. (USER FQDN) Authentication.

If users use dynamic IP address to connect with the device, users may select this type to link to VPN. When the remote VPN gateway requires connection to facilitate VPN connection, the device will start authentication and respond to the VPN tunnel connection; Please enter the E-Mail to the empty space.

Remote Security Group Type:

This option allows users to set the remote VPN connection access type. The following offers a few items for remote settings. Please select and set appropriate parameters:

(1) IP address

This option allows the only IP address which is entered to build the VPN tunnel.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.2.1 can establish connection.

(2) Subnet

This option allows local computers in this subnet can be connected to the VPN tunnel.

Reference: When this VPN tunnel is connected, only computers with the session of 192.168.2.0 and with subnet mask as 255.255.255.0 can connect with remote VPN.

(3) IP Address Range

This option allows connection only when IP address range which is entered after the VPN tunnel is connected.

Reference: When this VPN channel is connected, computers with the IP address range between 192.168.2.1 and 192.168.1.254 can establish connection.

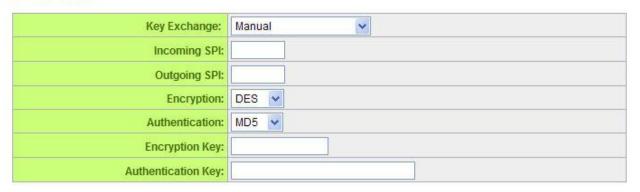

IPSec Setup

If there is any encryption mechanism, the encryption mechanism of these two VPN tunnels must be identical in order to create connection. And the transmission data must be encrypted with IPSec key, which is known as the encryption "key". The device provides the following two encrypted Key Managements. They are Manual and IKE

automatic encryption mode- IKE with Preshared Key (automatic). By using the drop down menu, select the desired encryption mode as illustrated below.

O IPSec Setup

Encryption Management Protocol:

When users set this VPN tunnel to use any encryption and authentication mode, users must set the parameter of this exchange password with that of the remote. Setting methods include Auto (IKE) or Manual. To do the settings, select any one from the two options.

O IPSec Setup

Advanced +

Use IKE Protocol:

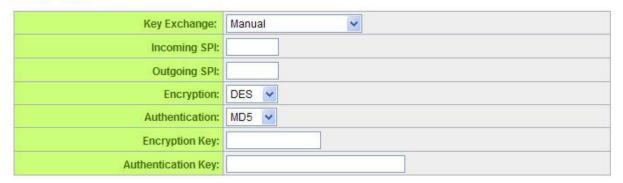

Click the shared key generated by IKE to encrypt and authenticate the remote user. If PFS (Perfect Forward Secrecy) is enabled, the Phase 2 shared key generated during the IKE coordination will conduct further encryption and authentication. When PFS is enabled, hackers using brute force to capture the key will not be able to get the Phase 2 key in such a short period of time.

- Perfect Forward Secrecy: When users check the PFS option, don't forget to activate the PFS function of the VPN device and the VPN Client as well.
- Phase 1/ Phase 2 DH Group: This option allows users to select Diffie-Hellman groups: Group 1/ Group 2/
 Group 5.
- Phase 1/ Phase 2 Encryption: This option allows users to set this VPN tunnel to use any encryption mode. Note that this parameter must be identical to that of the remote encryption parameter: DES (64-bit encryption mode), 3DES (128-bit encryption mode), AES (the standard of using security code to encrypt information). It supports 128-bit, 192-bit, and 256-bit encryption keys.
- Phase 1/Phase 2 Authentication: This authentication option allows users to set this VPN tunnel to use any authentication mode. Note that this parameter must be identical to that of the remote authentication mode: "MD5" or "SHA1".
- Phase 1 SA Life Time: The life time for this exchange code is set to 28800 seconds (or 8hours) by default.
 This allows the automatic generation of other exchange password within the valid time of the VPN connection so as to guarantee security.
- Phase2 SA Life Time: The life time for this exchange code is set to 3600 seconds (or 1hours) by default.
 This allows the automatic generation of other exchange password within the valid time of the VPN connection so as to guarantee security.
- Preshared Key: For the Auto (IKE) option, enter a password of any digit or characters in the text of "Pre-shared Key" (the example here is set as test), and the system will automatically translate what users entered as exchange password and authentication mechanism during the VPN tunnel connection. This exchange password can be made up of up to 30 characters.

Manual Mode (Future)

O IPSec Setup

If the Manual mode is selected, users need to set encryption key manually without negotiation.

- It is divided into two types: "Encryption KEY" and "Authentication KEY". Users may enter an exchange password made up of either digits or characters. The systems will automatically translate what users entered into the exchange password and authentication mechanism during the VPN tunnel connection. This exchange password can be made up of digits and characters up to 23.
- Moreover, the exchange strings for "Incoming SPI" and "Outgoing SPI" must be identical to those of the connected VPN device. For the Incoming SPI parameters, users must set it the same with the Outgoing SPI string of the remote VPN device. And the Outgoing SPI string must be the same with the incoming SPI string of the remote VPN device.

Advanced Setting- for IKE Protocol Only

Advanced

	Aggressive Mode
	Compress (Support IP Payload Compression Protocol(IPComp))
	Keep-Alive
	AH Hash Algorithm MD5 💌
	Allow NetBIOS Broadcast Pass Through
	NAT Traversal
V	Dead Peer Detection(DPD) Interval 10 seconds
	Allow specific boardcast packet Pass through Service Port Management
	Apply Cancel

The advanced settings include Main Mode and Aggressive mode. For the Main mode, the default setting is set to

VPN operation mode. The connection is the same to most of the VPN devices.

- Aggressive Mode: This mode is mostly adopted by remote devices. The IP connection is designed to enhance the security control if dynamic IP is used for connection.
- Use IP Header Compression Protocol: If this option is selected, in the connected VPN tunnel, the device supports IP Payload Compression Protocol.
- Keep Alive: If this option is selected, VPN tunnel will keep this VPN connection. This is mostly used to connect the remote node of the branch office and headquarter or used for the remote dynamic IP address.
- AH hash calculation: For AH (Authentication Header), users may select MD5/DSHA-1.
- NetBIOS Broadcast: If this option is selected, the connected VPN tunnel allows the passage of NetBIOS broadcast packet. This facilitates the easy connection with other Microsoft network; however, the traffic using this VPN tunnel will increase.
- Dead Peer Detection (DPD): If this option is selected, the connected VPN tunnel will regularly transmit
 HELLO/ACK message packet to detect whether there is connection between the two ends of the VPN
 tunnel. If one end is disconnected, the device will disconnect the tunnel automatically and then create
 new connection. Users can define the transmission time for each DPD message packet, and the default
 value is 10 seconds.

10.1.2.2. Client to Gateway Setting

The following describes how an administrator builds a VPN tunnel between devices. Users can set this VPN tunnel to be used by one client or by a group of clients (Group VPN) at the client end. If it is used by a group of clients, the individual setting for remote clients can be reduced. Only one tunnel will be set and used by a group of clients, which allows easy setting.

Situation in Tunnel:

Tunnel No.: Set the embedded VPN feature, please select the Tunnel number.

Displays the current VPN tunnel connection name, such as XXX Office. Users

are well-advised to give them different names to avoid confusion.

Tunnel Name: Note: If this tunnel is to be connected to the other VPN device, some device

requires that the tunnel name is identical to the name of the host end to

facilitate verification. This tunnel can thus be successfully enabled.

Interface: Users may select which port to be the node for this VPN channel. They can be

applied for VPN connections.

Enabled: Click to Enable to activate the VPN tunnel. This option is set to Enable by

default. After users set up, users may select to activate this tunnel feature.

Local Group Setup

This local gateway authentication type (Local Security Gateway Type) must be identical with that of the remote type (Remote Security Gateway Type).

Local Security Gateway Type: This local gateway authentication type comes with five operation modes,

which are:

IP only - Authentication by the use of IP only

IP + Domain Name (FQDN) Authentication, -IP + Domain name

IP + E-mail Addr. (USER FQDN) Authentication,-IP + Email address **Dynamic IP + Domain Name (FQDN) Authentication,** -Dynamic IP address + Domain name

Dynamic IP + E-mail Addr. (USER FQDN) Authentication. Dynamic IP address + Email address name

(1) IP only:

If users decide to use **IP only**, entering the IP address is the only way to gain access to this tunnel. The WAN IP address will be automatically filled into this space. Users don't need to do further settings.

(2) IP + Domain Name(FQDN) Authentication:

If users select IP + domain name type, please enter the domain name and IP address. The WAN IP address will be automatically filled into this space. Users don't need to do further settings. FQDN refers to the combination of host name and domain name and can be retrieved from the Internet, i.e. vpn.server.com. This IP address and domain name must be identical to those of the VPN secure gateway setting type to establish successful connection.

(3) IP + E-mail Addr. (USER FQDN) Authentication.

If users select IP address and E-mail, enter the IP address and E-mail address to gain access to this tunnel and the WAN IP address will be automatically filled into this space. Users don't need to do further settings.

(4) Dynamic IP + Domain Name(FQDN) Authentication:

If users use dynamic IP address to connect to the device, users may select this option to link to VPN. If the remote VPN gateway requires connection to the device for VPN connection, this device will start authentication and respond to this VPN tunnel connection; if users select this option to link to VPN, please enter the domain name.

(5) Dynamic IP + E-mail Addr. (USER FQDN) Authentication.

If users use dynamic IP address to connect to the device, users may select this option to connect to VPN without entering IP address. When VPN Gateway requires for VPN connection, the device will start authentication and respond to VPN tunnel connection; if users select this option to link to VPN, enter E-Mail address to the empty field for E-Mail authentication.

Local Security Group Type:

This option allows users to set the local VPN connection access type. The following offers a few items for local settings. Please select and set appropriate parameters:

4. IP address

This option allows the only IP address which is entered to build the VPN tunnel.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.1.0 can establish connection.

5. Subnet

This option allows local computers in this subnet to be connected to the VPN tunnel.

Reference: When this VPN tunnel is connected, only computers with the session of 192.168.1.0 and with subnet mask as 255.255.255.0 can connect with remote VPN.

6. IP Range

This option allows connection only when IP address range which is entered after the VPN tunnel is connected.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.1.0 ~254 can establish connection.

Remote Group Setup:

address of 192.168.1.0 can establish connection.

8. Subnet

This option allows local computers in this subnet can be connected to the VPN tunnel.

Reference: When this VPN tunnel is connected, only computers with the session of 192.168.1.0 and with subnet mask as 255.255.255.0 can connect with remote VPN.

9. IP Range

This option allows connection only when IP address range which is entered after the VPN tunnel is connected.

Reference: When this VPN tunnel is connected, computers with the IP address of 192.168.1.0 $^{\sim}254$ can establish connection.

Remote Group Setup

Remote Group Setup

Remote Security client This setting offers three operation modes, which are:

Type: Domain Name (FQDN)

E-mail Address (USER FQDN)

Microsoft XP/2000 VPN Client

(1) Domain Name(FQDN)

If users select Domain Name type, please enter the domain name to be authenticated. FQDN refers to the combination of host name and domain name that are available on the Internet (i.e. vpn.Server.com). The domain name must be identical to the status setting of the client end to

establish successful connection.

(2) E-mail Addr. (USER FQDN)

If users select this option, only filling in the E-mail address allows access to this tunnel.

(3) Microsoft XP/2000 VPN Client

If users select XP/2000 VPN Client end status, users don't need to do extra settings.

IPSec Setup

If there is any encryption mechanism, the encryption mechanism of these two VPN channel settings must be identical in order to establish connection. And the transmission data must be encrypted with IPSec key, which is also known as the encryption "key". The device provides the following two types of encryption management modes: Manual and IKE automatic encryption mode- IKE with Preshared Key (automatic). If the Group VPN is selected or the dynamic IP address of the Remote Security Gateway Type is applied, Aggressive Mode will be enabled automatically without the option of Manual mode.

Encryption Management Protocol:

IPSec Setup

Key Exchange:	IKE with Preshared Key
Phase1 DH Group:	Group 1 🔻
Phase1 Encryption:	DES v
Phase1 Authentication:	MD5 💌
Phase1 SA Life Time:	28800 Seconds
Perfect Forward Secrecy	▼
Phase2 DH Group:	Group 1 💌
Phase2 Encryption:	DES v
Phase2 Authentication:	MD5 ·
Phase2 SA Life Time:	3600 Seconds
Preshared Key:	
Phase2 DH Group: Phase2 Encryption: Phase2 Authentication: Phase2 SA Life Time:	Group 1 V DES V MD5 V 3600 Seconds

Advanced -

- Perfect Forward Secrecy: When users check the PFS option, make sure to activate the PFS feature of the
 VPN device and that VPN Client as well.
- Phase 1/Phase 2 DH Group: This option allows users to select Diffie-Hellman groups: Group 1/ Group 2/ Group 5.
- Phase1/Phase2 Encryption: This option allows users to set this VPN channel to use any encryption mode. Note that this parameter must be identical to that of the remote encryption parameter: DES (64 bit encryption mode), 3DES (128-bit encryption mode), AES (the standard of using security code to encrypt information). It supports 128-bit, 192-bit, and 256-bit encryption keys.
- Phase 1/Phase 2 Authentication: This authentication option allows users to set this VPN tunnel to use any authentication mode. Note that this parameter must be identical to that of the remote authentication mode: "MD5" or "SHA1".
- Phase1 SA Life Time: The life time for this exchange code is 28800 seconds (or 8 hours) by default. This
 allows the automatic generation of other exchange passwords within the valid time of the VPN
 connection so as to guarantee security.
- Phase2 SA Life Time: The life time for this exchange code is 3600 seconds (or 1 hour) by default. This
 allows the automatic generation of other exchange passwords within the valid time of the VPN
 connection so as to guarantee security.
- Preshared Key: For the Auto (IKE) option, enter a password of any digit or character in the text of

"Pre-shared Key" (the example here is set as test), and the system will automatically translate what users entered as exchange password and authentication mechanism during the VPN tunnel connection. This exchange password can be made up of up to 30 characters.

Advanced Setting-for IKE Preshared Key Only

Advanced

	Aggressive Mode
	Compress (Support IP Payload Compression Protocol(IPComp))
	Keep-Alive
	AH Hash Algorithm MD5 💌
	Allow NetBIOS Broadcast Pass Through
	NAT Traversal
V	Dead Peer Detection(DPD) Interval 10 seconds
	Allow specific broadcast packet Pass through Service Port Management

The advanced settings include Main Mode and Aggressive mode. In Main mode, the default setting is VPN operation mode. The connection is the same as most of the VPN device.

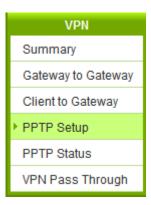

- Aggressive Mode: This mode is mostly adopted by remote devices. The IP connection is designed to enhance the security control if dynamic IP is used for connection.
- Use IP Header Compression Protocol: If this option is selected, in the connected VPN tunnel, the device supports IP Payload compression Protocol.
- Keep Alive: If this option is selected, VPN channel will keep this VPN connection. This is mostly used to connect the remote node of the branch office and headquarter or used for the remote dynamic IP address.
- AH Hash Calculation: For AH (Authentication Header), users may select MD5/DSHA-1.
- NetBIOS Broadcast: If this option is selected, the connected VPN tunnel allows the passage of NetBIOS broadcast packet. This facilitates the easy connection with other Microsoft Network Neighborhoods; however, the traffic using this VPN tunnel will increase.
- Dead Peer Detection (DPD): If this option is selected, the connected VPN tunnel will regularly transmit HELLO/ACK message packet to detect whether there is connection between the two ends of the VPN tunnel. If one end is disconnected, the device will disconnect the tunnel automatically and then create new connection. Users can define the transmission time for each DPD message packet, and the default

value is 10 seconds

10.1.3. PPTP Setting

It supports the PPTP of Window XP/ 2000 to create point-to-point tunnel protocol for single- device users to create VPN connection.

✓ Enabled PPTP Server

PPTP Client IP Range

pass in order to connect with external VPN device.

will still keep the connection with UDP 500.

L2TP Pass Through: If this option is **enabled**, the PC end is allowed to use VPN- L2TP

packet to pass in order to connect with external VPN device.

After modification, push "Apply" button to save the network setting or push "Cancel" to keep the settings unchanged.

10.2. QnoKey

Introduces how Qno VPN devices conducts preliminary configuration of the data from the user end and how to set the QnoKey user to successfully create QnoKey by using QnoKey management software.

10.2.1. QnoKey Summary

Login to the web-based UI and click on the QnoKey menu to display the page that summarizes the current status information of QnoKey, as illustrated below:

QnoKey Tunnel Number: 0 Tunnel(s) Used

100 Tunnel(s) Available

QnoKey Client Table

Displays how many tunnels are applied and the total tunnel number of **QnoKey Tunnel Number:**

QnoKey tunnel. Through advanced setting, users can set the tunnel number

of IPSec and QnoKey.

Displays whether QnoKey username is enabled. **Enabled:**

Displays the user name group of QnoKey. Account ID:

Server IP address or the applied domain name. **Local IP Address (Domain**

Name):

The present valid time of QnoKey; permanent use is displayed as Forever. Life Time:

If the number of days of using QnoKey is set, the remaining time is displayed **Available Time:**

here.

Account Number Limitation: The upper limited number of QnoKey users.

Used Number: The number of QnoKey in use.

Online Number: Displays the number of connected devices that are using QnoKey.

Show Table: Displays the list of all QnoKey users.

Delete: Deletes one user name group setting rule.

Goes to the page where summarized information is needed.

Go to page:

Each summary page displays several group messages.

Entries per page:

Add Qnokey Group: Add new group settings.

Delete All Group: Delete all the group settings.

10.2.2 Qnokey Group Setup

Press Add New Qnokey Group to enter Group Setup page, as illustrated below.

Group Account Setup

☑ Enable this rule

This page is designed for QnoKey group setup. Group parameters for QnoKey include WAN ports, valid time, and number of users, and protection actions for potential QnoKey losses. These setting options facilitate classified

management for QnoKey users and enhance security.

Enable this rule: Select this option to activate this setting rule.

Group Account ID: Enter the QnoKey group name that users would like to set up.

Interface:

Select WAN port and enter the correct IP address which corresponds to WAN port or the domain name (analyzed by DDNS). If WAN ports are empty, IP entry is not necessary so that VPN connection will not fail. This option allows users to select which WAN port to make connection, facilitating management. If WAN1 is selected, QnoKey group users can connect through only WAN1. If both WAN 1 and WAN 2 are selected, QnoKey group users are allowed to make connection via WAN 1 or WAN 2. When WAN1 is disconnected, WAN2 will be automatically connected to back up VPN connection.

Note:

- If WAN port is selected and the network connection type is set as static IP, the system will automatically display this WAN IP. Administrator does not need to enter it manually.
- If WAN port is selected and the network connection is set to other types such as DHCP/PPPoE, administrator needs to enter the IP address or domain name (through DDNS analysis).

Life Time:

Set the valid time for QnoKey group. If the QnoKey is for normal and frequent use, the option "Forever" may be selected so the user end valid time is infinite. If the user is more complicated or if it is meant for mobile users who travel on business, the VPN security can be guaranteed by setting the valid time of QnoKey as "1~99" days according to the desired number of days to be set.

Account Number

Limitation: Set the maximum number of QnoKey users (from "1~100")

allowed by the group setting rules.

Stolen Key Login Action:

In the drop-down list, select operation options for the missing

QnoKey.

In the event of losing QnoKey, there are three options for selection: "Do Nothing", "Clear Key," and "Lock Key". Setting this feature on QnoKey can enhance VPN security. Select "Do Nothing" to do no change after the Key is lost. Select "Clear Key" to clean up the QnoKey settings when the VPN connection is established again after the QnoKey is lost. Select "Block Key" to block the VPN connection after the QnoKey is lost.

Press "Apply" to confirm the group settings and press "Cancel" to cancel the setting. Press "Back" to return the previous page.

Pressing "Apply" to display a dialog box in which it will ask if users want to continue to add new setting group.

Click "Ok" to add another group setting or "Cancel" to return to the QnoKey Summary page. It is illustrated as below.

On the QnoKey Summary page, the defined group will be displayed, which is illustrated as below.

QnoKey Client Table

When a new rule is created, "Show List" and "Edit" button will be displayed behind the rule. Click on "Show List" to show the list of users applying this group rule. Click "Edit" to change settings. Click the trash can icon to delete

this setting.

10.2.3 Qnokey Account List

Click "Show List" to show the Account List page applying this rule.

O Group Account list

Group Account ID: test 💌

No. Enabled QnoKey User Name Status Stolen Key Login Action Bind MAC MAC Address Remote Client IP Dele
--

Group Account ID: Displays the group ID to which the user belongs to.

Enabled: Click this option to activate QnoKey user.

QnoKey SN: Displays the QnoKey serial number.

User Name: Displays the QnoKey user name.

Status: Displays the QnoKey connection status. "Connect" means the user is

connected and online; "Disconnect" means no connection and offline.

Stolen Key Login Action: Select this option to create settings if the QnoKey is lost.

Bind MAC: If there is hardware binding, QnoKey can only execute on the bound PC.

MAC Address: If hardware binding function is enabled, it will show the MAC address

which Qnokey is bound with, not the PC MAC address.

Delete: Delete the user Qnokey connection information.

10.3. QVM VPN Function Setup

The QVM-series device provides three major convenient functions:

- 1. Smart Link IPSec VPN: Easy VPN setup replaces the conventional complicated VPN setup process by entering Server IP, User Name, and Password.
- 2. **Central Control Feature:** Displays a clear VPN connection status of all remote ends and branches. Its central control screen allows setup from remote into external client ends.
- 3. **VPN Disconnection Backup:** Solves data transmission problem arising from failed ISP connection with remote ends or the branches.

10.3.1. QVM Server Settings

Select QVM Feature as Server mode:

O Setup Mode

QVM VPN (IP Address or Input QVM VPN Server IP address or domain name.

Dynamic Domain Name):

Status: Displays QVN connection status.

This function is to set re- connect duration if QVM contention drops.

Keep Alive: Redial Period

Mins: The range is 1^{60} mins.

QVM Backup Tunnel: You can input at most 3 backup IP addresses or domain names for

backup. Once the connection is dropped, the function will be

automatically enabled to backup the VPN connection and ensure

data transition security.

Advanced Function: In some environment, port 443 has been used, for example, E-Mail

Change QVM Client's Service Forwarding. To avoid the conflict with QVM, QVM port can be

Port: changed to other encryption ports, such as 10443.

After modification, press "Apply" to save the network setting or press "Cancel" to keep the settings unchanged.

XI. Advanced Function

This chapter will introduce to you the advance router settings In the advance settings, you can:

- 1. Setup DMZ servers forwarding to WAN, for example, the Web or FTP servers.
- 2. Setup static routing entries or dynamic routing protocol.
- 3. Setup one to one NAT function to mapping public IP address and private IP address.
- 4. Setup dynamic DNS service.
- 5. Setup MAC address in interfaces.

11.1 DMZ/Forwarding

DMZ Host

0

Port Range Forwarding

11.1.1 DMZ Configuration

When the NAT mode is activated, sometimes users may need to use applications that do not support virtual IP addresses such as network games. We recommend that users map the device actual WAN IP addresses directly to the Intranet virtual IP addresses, as follows:

If the "DMZ Host" function is selected, to cancel this function, users must input "0" in the following "DMZ Private IP". This function will then be closed.

After the changes are completed, click "Apply" to save the network configuration modification, or click "Cancel" to leave without making any changes.

11.1.2 Port Range Forwarding

Setting up a Port Forwarding Virtual Host: If the server function (which means the server for an external service such as WWW, FTP, Mail, etc) is contained in the network, we recommend that users use the firewall function to set up the host as a virtual host, and then convert the actual IP addresses (the Internet IP addresses) with Port 80 (the service port of WWW is Port 80) to access the internal server directly. In the configuration page, if a web server address such as 192.168.1.50 and the Port 80 has been set up in the configuration, this web page will be accessible from the Internet by keying in the device actual IP address such as, http://211.243.220.43.

At this moment, the device actual IP will be converted into "192.168.1.50" by Port 80 to access the web page.

In the same way, to set up other services, please input the server TCP or UDP port number and the virtual host IP addresses.

Port Range Forwarding

To select from this option the default list of service ports of the virtual host that users want to activate.

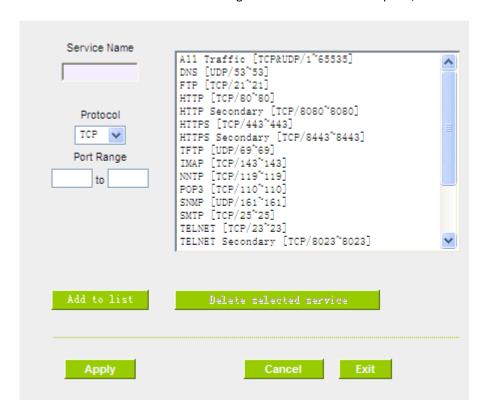

Such as: All (TCP&UDP) 0~65535, 80 (80~80) for WWW, and 21~21 for FTP. Please refer to the list of default service ports.

IP Address	Input the virtual host IP address.
Enable	Activate this function.
Service Port Management	Add or remove service ports from the list of service ports.
Add to list	Add to the active service content.

Service Port Management

The services in the list mentioned above are frequently used services. If the service users want to activate is not in the list, we recommend that users use "Service Port Management" to add or remove ports, as follows:

Service Name	Input the name of the service port users want to activate on the list, such as E-donkey, etc.
Protocol	To select whether a service port is TCP or UDP.
Port Range	To activate this function, input the range of the service port locations users want to activate such as 500~500 or 2300~2310, etc.
Add to list	Add the service to the service list.

Delete selected item	To remove the selected services.
Apply	Click the "Apply" button to save the modification.
Cancel	Click the "Cancel" button to cancel the modification. This only works before "Apply" is clicked.
Exit	Quit this configuration window.

11.2 UPnP

UPnP (Universal Plug and Play) is a protocol set by Microsoft. If the virtual host supports UPnP system (such as Windows XP), users could also activate the PC UPnP function to work with the device.

UPnP Mapping

Service Port: Select the UPnP service number default list here; for example, WWW is

80~80, FTP is 21~21. Please refer to the default service number list.

Host Name or IP Address: Input the Intranet virtual IP address or name that maps with UPnP such as

192.168.1.100.

Enabled: Activate this function.

Service Port Management : Add or remove service ports from the management list.

Add to List: Add to active service content.

Delete Selected Item: Remove selected services.

Show Table: This is a list which displays the current active UPnP functions.

Apply: Click "Apply" to save the network configuration modification.

Cancel: Click "Cancel" to leave without making any change.

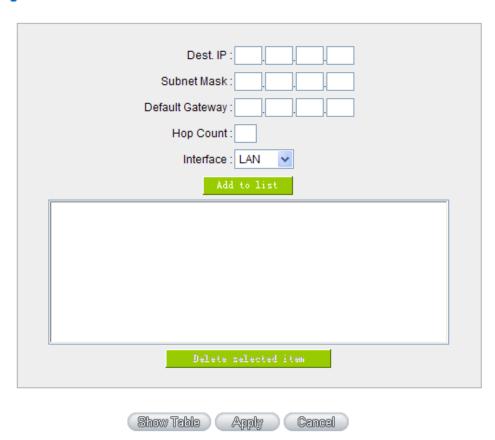

11.3 Routing

In this chapter we introduce the Dynamic Routing Information Protocol and Static Routing Information Protocol.

Dynamic Routing

Static Routing

11.3.1 Dynamic Routing

The abbreviation of Routing Information Protocol is RIP. There are two kinds of RIP in the IP environment – RIP I and RIP II. Since there is usually only one router in a network, ordinarily just Static Routing will be used. RIP is used when there is more than one router in a network, and if an administrator doesn't want to assign a path list one by one to all of the routers, RIP can help refresh the paths.

RIP is a very simple routing protocol, in which Distance Vector is used. Distance Vector determines transmission distance in accordance with the number of routers, rather than based on actual session speed. Therefore, sometimes it will select a path through the least number of routers, rather than through the fastest routers.

Dynamic Routing

Working Mode:	Gateway	ORouter
RIP:	OEnabled	Disabled
Receive RIP versions:	None	<u> </u>
Transmit RIP versions :	None	v

Working Mode	Select the working mode of the device: NAT mode or router mode.
RIP	Click "Enabled" to open the RIP function.
Receive RIP versions	Use Up/Down button to select one of "None, RIPv1, RIPv2, Both RIPv1 and v2" as the "TX" function for transmitting dynamic RIP.
Transmit RIP versions	Use Up/Down button to select one of "None, RIPv1, RIPv2-Broadcast, RIPv2-Multicast" as the "RX" function for receiving dynamic RIP.

11.3.2 Static Routing

When there are more than one router and IP subnets, the routing mode for the device should be configured as static routing. Static routing enables different network nodes to seek necessary paths automatically. It also enables different network nodes to access each other. Click the button "Show Routing Table" (as in the figure) to display the current routing list.

Static Routing

Show Table	Apply	Cancel
200200 100505	o deledi	0000000

Dest. IP Subnet Mask	Input the remote network IP locations and subnet that is to be routed. For example, the IP/subnet is 192.168.2.0/255.255.255.0.	
Default Gateway	The default gateway location of the network node which is to be routed.	
Hop Count	This is the router layer count for the IP. If there are two routers under the device, users should input "2" for the router layer; the default is "1". (Max. is 15.)	
nterface This is to select "WAN port" or "LAN port" for network connection local		
Add to List	Add the routing rule into the list.	
Delete Selected Item	Remove the selected routing rule from the list.	
Show Table	Show current routing table.	
Apply	Click "Apply" to save the network configuration modification	

Cancel	Click "Cancel" to leave without making any changes.
	ener energy to read the manning any energees

11.4 One to One NAT

As both the device and ATU-R need only one actual IP, if ISP issued more than one actual IP (such as eight ADSL static IP addresses or more), users can map the remaining real IP addresses to the intranet PC virtual IP addresses. These PCs use private IP addresses in the Intranet, but after having One to One NAT mapping, these PCs will have their own public IP addresses.

For example, if there are more than 2 web servers requiring public IP addresses, administrators can map several public IP addresses directly to internal private IP addresses.

Example: Users have five available IP addresses - 210.11.1.1~5, one of which, 210.11.1.1, has been configured as a real IP for WAN, and is used in NAT. Users can respectively configure the other four real IP addresses for Multi-DMZ, as follows:

 $210.11.1.2 \rightarrow 192.168.1.3$ $210.11.1.3 \rightarrow 192.168.1.4$ $210.11.1.4 \rightarrow 192.168.1.5$ $210.11.1.5 \rightarrow 192.168.1.6$

Note!

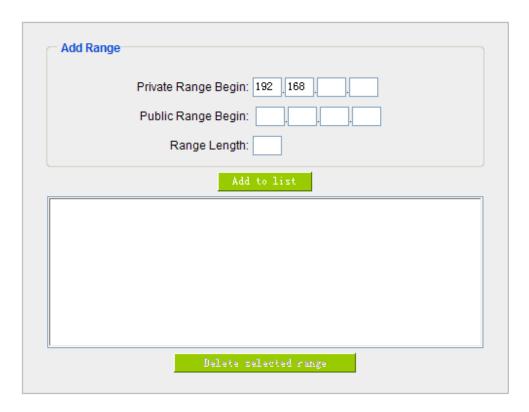

The device WAN IP address can not be contained in the One-to-One NAT IP configuration.

One to One NAT:

Enable One-to-One NAT 🗸

One to One NAT

Enable Multiple to One NAT

Enable One to One NAT	To activate or close the One-to-One NAT function. (Check to activate the function).
Private IP Range Begin	Input the Private IP address for the Intranet One-to-One NAT function.
Public IP Range Begin	Input the Public IP address for the Internet One-to-One NAT function.
Range Length The numbers of final IP addresses of actual Internet IP addresses. include IP addresses in use by WANs.)	

Add to List	Add this configuration to the One-to-One NAT list.	
Delete Selected range	Remove a selected One-to-One NAT list.	
Apply:	Click "Apply" to save the network configuration modification.	
Cancel:	Click "Cancel" to leave without making any changes.	

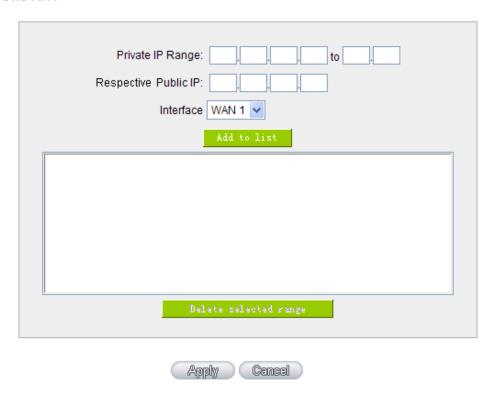

Note!

One-to-One NAT mode will change the firewall working mode. If this function has been set up, the Internet IP server or PC which is mapped with a LAN port will be exposed on the Internet. To prevent Internet users from actively connecting with the One-on-One NAT server or PC, please set up a proper denial rule for access, as described Firewall.

Multiple to One NAT:

Enable Multiple to One NAT 🗹

Multiple to One NAT

Enable Multiple to One NAT

Click to enable multiple to one NAT function.

Private IP Range

Input intranet IPs for NAT mapping.

Respective Public IP

Input the respective public IP addresses. This should go along with the following interface selection. If the IP address is not within the interface ranges, the

setting will not work.

Interface

Select the mapping interface. If the WAN IP above is not within the interface

range, the setting will not work.

Add to List

Add this configuration to the One-to-One NAT list.

Delete selected range

Remove a selected One-to-One NAT list.

Apply

Click "Apply" to save the network configuration modification.

Cancel

Click "Cancel" to leave without making any changes.

11.5 DDNS- Dynamic Domain Name Service

DDNS supports the dynamic web address transfer for QnoDDNS.org.cn、3322.org、DynDNS.org and DtDNS.com. This is for VPN connections to a website that is built with dynamic IP addresses, and for dynamic IP remote control. For example, the actual IP address of an ADSL PPPoE time-based system or the actual IP of a cable modem will be changed from time to time. To overcome this problem for users who want to build services such as a website, it offers the function of dynamic web address transfer. This service can be applied from www.qno.cn/ddns.www.3322.org, www.dyndns.org, or www.dtdns.com, and these are free.

Also, in order to solve the issue that DDNS server is not stable, the device can update the dynamic IP address with different services at the same time.

DDNS Setup

Interface	Status	Host Name	Config.
WAN 1	Dyndns Disabled 3322 Disabled Qnoddns Disabled	Dydns: 3322: Qno:	<u>Edit</u>
WAN 2	Dyndns Disabled 3322 Disabled Qnoddns Disabled	Dydns: 3322: Qno:	<u>Edit</u>

	Input a complete website address such as abc.qnoddns.org.cn as a user name for QnoDDNS.	
Password	The password which is set up for DDNS.	
Host Name	Input the website address which has been applied from DDNS. Examples are	
	abc.dyndns.org or xyz.3322.org.	

Internet IP Address	Input the actual dynamic IP address issued by the ISP.	
Status	An indication of the status of the current IP function refreshed by DDNS.	
Apply	After the changes are completed, click "Apply" to save the network configuration modification.	
Cancel	Click "Cancel" to leave without making any changes.	

11.6 MAC Clone

Some ISP will request for a fixed MAC address (network card physical address) for distributing IP address, which is mostly suitable for cable mode users. Users can input the network card physical address (MAC address: 00-xx-xx-xx-xx) here. The device will adopt this MAC address when requesting IP address from ISP.

MAC Clone

Interface	MAC Address	Config.
WAN 1	00-78-78-11-CE	Edit
WAN 2	00-78-78-78-11-CF	Edit
WAN 3	00-78-78-78-11-D0	Edit
WAN 4	00-78-78-11-D1	Edit
WAN 5	00-78-78-11-D2	Edit

Select the WAN port to which the configuration is to be edited; click the hyperlink to enter and edit its configuration. Users can input the MAC address manually. Press "Apply" to save the setting, and press "Cancel" to remove the setting.

Default MAC address is the WAN MAC address.

Interface: \text{WAN1}		
User Defined WAN MAC Address:	00 -0e -a0 -50 -00 -01 (Default: 00-0e-a0-50-00-01)	
MAC Address from this PC :	O0-1f-c6-7b-8a-bd	
Back Apply Cancel		

XII . System Tool

This chapter introduces the management tool for controlling the device and testing network connection.

For security consideration, we strongly suggest to change the password. Password and Time setting is in Chapter 5.2.

12.1 Diagnostic

GIGABIT router provides a simple online network diagnostic tool to help users troubleshoot network-related problems. This tool includes **DNS Name Lookup** (Domain Name Inquiry Test) and **Ping (Packet Delivery/Reception Test)**.

DNS Name lookup

On this test screen, please enter the host name of the network users want to test. For example, users may enter www.abc.com and press "Go" to start the test. The result will be displayed on this page.

•	DNS Name Lookup		0	Ping
	Look up the name :	www.google.com		Go
	Name: Address:	www.google.com 66.249.89.104		

Ping

This item informs users of the status quo of the outbound session and allows the user to know the existence of computers online.

On this test screen, please enter the host IP that users want to test such as 192.168.5.20. Press "Go" to start the test. The result will be displayed on this screen.

12.2 Firmware Upgrade

Users may directly upgrade the GIGABIT Router firmware on the Firmware Upgrade page. Please confirm all information about the software version in advance. Select and browse the software file, click "Firmware Upgrade Right Now" to complete the upgrade of the designated file.

Note!

Please read the warning before firmware upgrade.

Users must not exit this screen during upgrade. Otherwise, the upgrade may fail.

Firmware Upgrade

Warning 1. When choosing previous firmware versions, all settings will restore back to default value.

- 2. Upgrading firmware may take a few minutes, please don't turn off the power or press the reset button.
- 3. Please don't close the window or disconnect the link, during the upgrade process.

12.3 Configuration Backup Import Configuration File Export Export Export Protocol Binding

Import Configuration File:

This feature allows users to integrate all backup content of parameter settings into the GIGABIT Router. Before upgrade, confirm all information about the software version. Select and browse the backup parameter file: "config.exp." Select the file and click "Import" to import the file.

Export

Export Configuration File:

This feature allows users to backup all parameter settings. Click "Export" and select the location to save the "config.exp" file.

Export Configuration File:

This feature allows users to backup IP&MAC binding, QoS, and Protocol Binding setting rules. You can separately export the rules or import these rules from "Import Configuration File" above.

12.4 SNMP

Simple Network Management Protocol (SNMP) refers to network management communications protocol and it is also an important network management item. Through this SNMP communications protocol, programs with network management (i.e. SNMP Tools-HP Open View) can help communications of real-time management. The device supports standard SNMP v1/v2c and is consistent with SNMP network management software so as to get hold on to the operation of the online devices and the real-time network information.

SNMP Setup

SNMP Setup :Enabled <

System Name	
System Contact	
System Location	
Get Community Name	public
Set Community Name	private
Trap Community Name	
Send SNMP Trap to	

Apply Cancel

EnabledActivate SNMP feature. The default is activated.

System Name Set the name of the device such as Qno.

System Contact Set the name of the person who manages the device (i.e. John).

System Location Define the location of the device (i.e. Taipei).

Get Community Name Set the name of the group or community that can view the device SNMP

data. The default setting is "Public".

Set Community Name Set the name of the group or community that can receive the device SNMP

data. The default setting is "Private".

Trap Community Name

Set user parameters (password required by the Trap-receiving host computer)

to receive Trap message.

Send SNMP Trap to Set one IP address or Domain Name for the Trap-receiving host computer.

Apply Press "Apply" to save the settings.

Cancel Press "Cancel" to keep the settings unchanged.

12.5 System Recover

Users can restart the GIGABIT Router with System Recover button.

System Recover

Restart Router

Factory Default

Return to Factory Default Setting

Restart

As the figure below, if clicking "Restart Router" button, the dialog block will pop out, confirming if users would like to restart the device.

System Recover

Restart Router

Factory Default

Return to Factory Default Setting

If clicking "Return to Factory Default Setting, the dialog block will pop out, if the device will return to factory default.

Factory Default

We suggest you backup your router configuration before upgrade firmware, after upgraded firmware, you can reset router configuration to default for check the router stability, and then restore original router configuration. (About backup and restore router configuration, you can refer to Chapter 12.3)

12.6 High Availability

High Availability is adopted in the network that requires fault tolerance and backup mechanism. Two similar devices are used to be the backup for each other. One of these devices is employed for major network transmitting, and the other redundant device will take over when the master device fails to assure that network transmitting and services never break down. Therefore, administrators will have more opportunity and time to deal with the master device problems.

Besides general HA, Qno also provides advanced HA function that enables two devices to operate simultaneously. It brings full cost efficiency without making another device idle. It does not have to be the same model. All of Qno devices which support HA can achieve the function.

High Availability

High Availability	• Enable	C Disable	
Mode:	• Hardware Backup Mode	Two devices are operating simultaneously	
Operation:		C Backup Mode	
	Master / Slave Mode setting Of tv	wo devices must be different	
Status:	Normal		
Status of the backup	Status of the backup device: Normal		

High Availability

Enable: Activate HA function.

Disable: Disable HA function.

Mode

(1) Hardware Backup Mode

It is the general backup mode. The master device takes responsibility of network transmitting and the other one is set as idle. When the master device fails transmitting, it will send out the message to the idle device for taking over network transmitting immediately.

(2) Two devices are operating simultaneously

Two devices operate outbound linking simultaneously, but they are still separated as Master device and Backup device. In normal situation, Master device is major DHCP IP issuer, and Backup device will disable DHCP issuing automatically. When Master device fails transmitting, the Backup device will take over all outbound links and enable DHCP server to provide IP addresses.

Following is the description of the two different modes.

Hardware Backup

High Availability	♠ Enable	Disable	
Mode:	• Hardware Backup Mode	Two devices are operating simultaneously	
Operation:	① Master Mode	C Backup Mode	
	Master / Slave Mode setting Of two de	evices must be different	
Status:	Normal		
Status of the backup device: Normal			

Operation-Master Mode

Indicates the master device will operate for all outbound links. When the master device fails transmitting, the backup device will take over.

Status

"Status- Normal" indicates the device operates well.

Status of the backup device

Indicates status of backup device. If the status is normal, administrators can login the device remotely to manage. (Remote Management should be enabled).

"Status- Abnormal" indicates the backup device can not be detected or does exist, and need to inspect the backup device actual status.

High Availability	♠ Enable	C Disable
Mode:	• Hardware Backup Mode	Two devices are operating simultaneously
Operation:	Master Mode	Backup Mode
	Master / Slave Mode setting Of two de	evices must be different
LAN IP of the backup de	evice: 192 168 1	5
MAC Address of the ba	ckup device: 0 0 0	10 10 I
Status:	Normal	

Operation-Backup Mode

Indicates the backup device will take over when the master fails transmitting. WAN and LAN IP setting in backup device should be the same as those of master device. The backup device should not be in charge of network transmitting and DHCP server.

If the original LAN IP addresses are issued by Master device, DHCP server setting of Backup device should be the same as Master device. The Backup device can keep DHCP functioning and there will be no LAN disconnection.

LAN IP of the backup device

Input LAN IP of Master mode, which is backed up.

MAC Address of the backup device:

Input Master device MAC address, which is backed up.

Status

"Status- Normal" indicates the status is idle. Master device operates normally.

"Status- Backup" indicates the device takes over all the network transmitting. The status will return to "Normal" when Master device boots normally and send a message to the backup device. Then, the status will return to Normal, which the backup device remains idle.

Two devices are operating simultaneously:

	High Availability	♠ Enable	C Disable
	Mode:	C Hardware Backup Mode	Two devices are operating simultaneously

XIII. Log

From the log management and look up, we can see the relevant operation status, which is convenient for us to facilitate the setup and operation.

13.1 System Log

Its system log offers three options: system log, E-mail alert, and log setting.

Syslog

	Enable S	Syslog	
Syslog Server	:	Name or IP Addre	ess
	Alert Lo	g	
Syn Flooding	☐ IP Spoofing	☐ Win Nu	ke
Ping Of Death	✓ Unauthorized Login	n Attempt

	(Apply)	Cancel	

System Log

Enabled	If this option is selected, the System Log feature will be enabled.
Host Name	The device provides external system log servers with log collection feature.
	System log is an industrial standard communications protocol. It is designed to
	dynamically capture related system message from the network. The system log
	provides the source and the destination IP addresses during the connection,
	service number, and type. To apply this feature, enter the system log server name
	or the IP address into the empty "system log server" field.

Log Setting

Alert Log

Alert Log			
Syn Flooding	☐ IP Spoofing	☐ Win N	uke
Ping Of Death	✓ Unauthorized Logi	n Attempt	
General Log			
☐ Deny Policies ☐ Allow Policies		Authorized Login	
View System Log Outgoing Log Table Incoming Log Table Clear Log			Clear Log Now
(Apply) (Cancel)			

The GIGABIT Router provides the following warning message. Click to activate these features: Syn Flooding, IP Spoofing, Win Nuke, Ping of Death / Unauthorized Login Attempt.

Syn Flooding	Bulky syn packet transmission in a short time causes the overload of the system storage of record in connection information.
IP Spoofing	Through the packet sniffing, hackers intercept data transmitted on the network. After they access the information, the IP address from the sender is changed so that they can access the resource in the source system.
Win Nuke	Servers are attacked or trapped by the Trojan program.
Ping of Death	The system fails because the sent data exceeds the maximum packet that can be handled by the IP protocol.
Unauthorized Login	If intruders into the device are identified, the message will be sent to the system log.

General Log

The GIGABIT Router provides the following warning message. Click to activate the feature. System error message,

blocked regulations, regulation of passage permission, system configuration change and registration verification.

instance, message will be recorded in the system log.

instance, message will be recorded in the system log.

Authorized Login Successful entry into the system includes login from the remote end or from

the LAN into this device. These messages will be recorded in the system log.

The following is the description of the four buttons allowing online inquiry into the log.

View System Log:

This option allows users to view system log. The message content can be read online via the device. They include All Log, System Log, Firewall Log, and VPN log, which is illustrated as below.

13.4 IP/ Port Statistic

The GIGABIT Router allows administrators to inquire a specific IP (or from a specific port) about the addresses that this IP had visited, or the users (source IP) who used this service port. This facilitates the identification of websites that needs authentication but allows a single WAN port rather than Multi-WANs. Administrators may find out the destination IP for protocol binding to solve this login problem. For example, when certain port software is denied, inquiring about the IP address of this specific software server port may apply this feature. Moreover, to find out BT or P2P software; , users may select this feature to inquire users from the port.

Specific IP Status:

Enter the IP address that users want to inquire, and then the entire destination IP connected to remote devices as well as the number of ports will be displayed.

14.5 QRTG (Qno Router Traffic Graphic)

QRTG utilizes dynamic GUI and simple statistic to display system status of Qno Firewall/ Router presently, including CPU Utilization (%), Memory Utilization (%), Session and WAN Traffic.

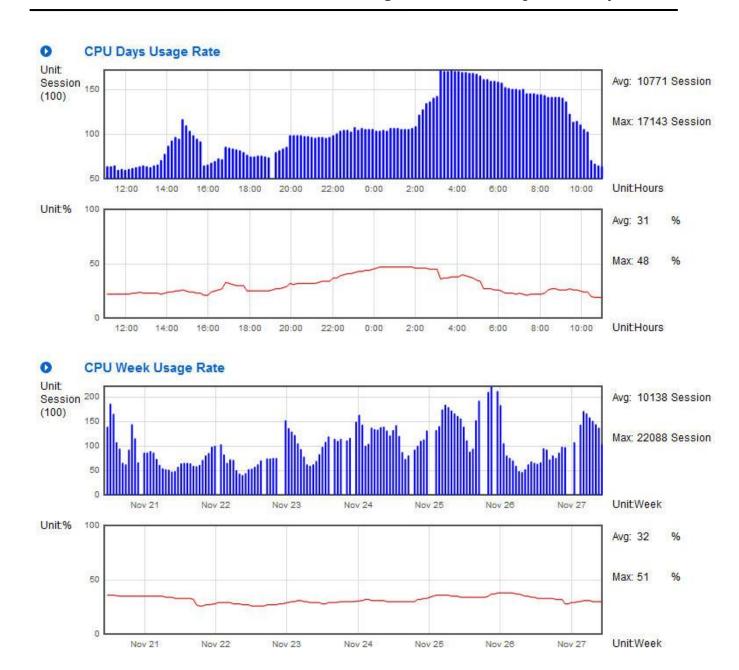

Enable QRTG: The function is disabled by default. When you are going to enable the QRTG function, system will pop-up a warning massage to remind you this function will be enabled, which may influence router efficiency. You can use drop down menu to select current status that including statistic and graphics of the following items when this function is enabled. System will refresh the statistic and graphics to latest data timing when you click "Refresh" button.

I. CPU Usage (As in the following figure)

- (1) CPU Hours Usage Rate graphic / average/ maximum
- (2) CPU Days Usage Rate graphic / average/ maximum
- (3) CPU, Week Usage Rate graphic / average/ maximum

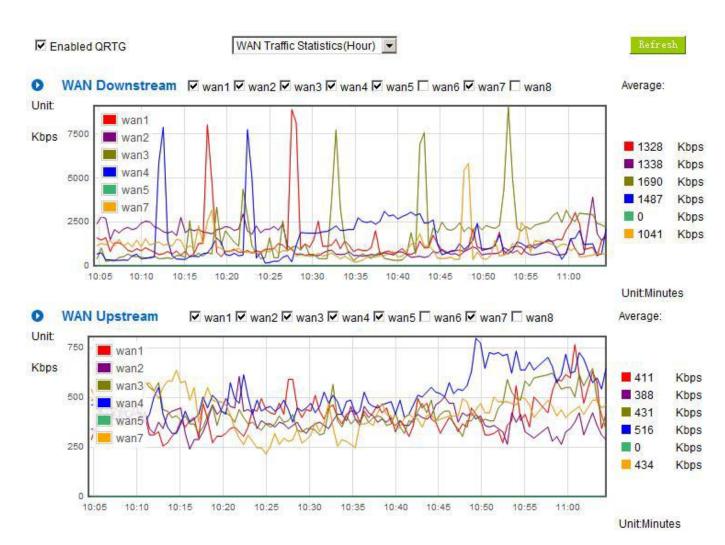

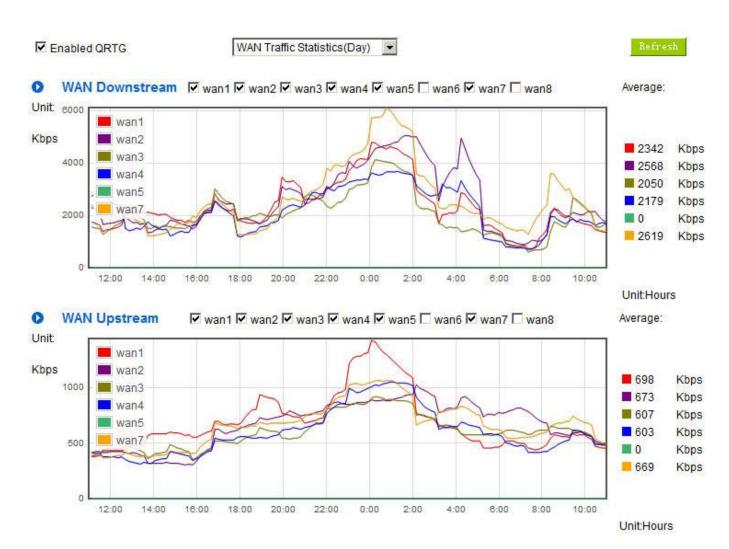

II. WAN Traffic Statistic (hourly) graphic and average (up/down stream) (As in the following figures)

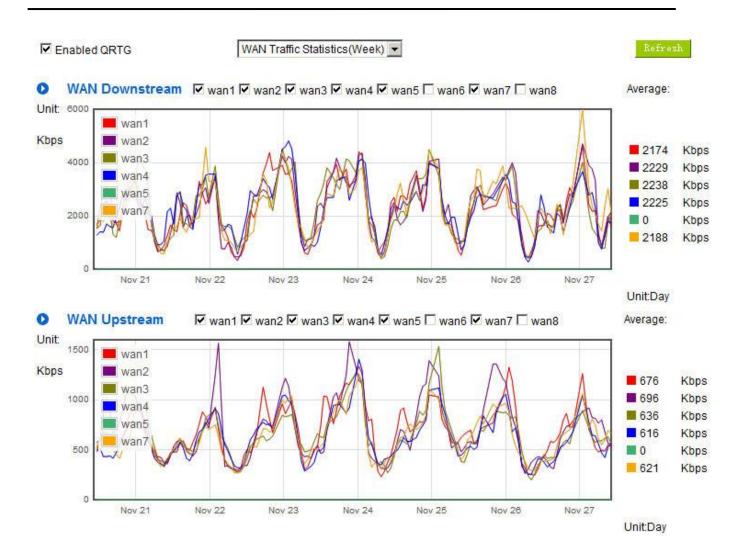

III. WAN Traffic Statistic (Day) graphic and average (up/down stream)(As in the following figures)

IV. WAN Traffic Statistic (Week) graphic and average (up/down stream)(As in the following figures)

XV. Log out

On the top right corner of the web- based UI, there is a Logout button. Click on it to log out of the web- based UI. To enter next time, open the Web browser and enter the IP address, user name and password to log in.

Appendix I: User Interface and User Manual Chapter Cross Reference

This appendix is to show the corresponding index for each chapter and user interface. Users can find how to setup quickly and understand the GIGABIT Router capability at the same time.

Router overall index is as below.

Category	Sub- category	Chapter
Home		V. Device Spec Verification, Status Display and
		Login Password and Time Setting
		5.1 Home
Basic Setting		VI. Network
	Network Connection	6.1 Network Connection
	Traffic Management	6.2 Multi- WAN Setting
	Protocol Binding	6.2 Multi- WAN Setting
QoS		VIII. QoS
	Bandwidth	8.1 (QoS)
	Management	8.3 Bandwidth Management
	Session Control	8.2 Session Limit
IP/DHCP		VII. Port Management
	Setup	7.3 DHCP/ IP

	Status	7.4 DHCP Status
	IP & MAC Binding	7.5 IP & MAC Binding
	IP Grouping	7.6 IP Grouping
	Port Grouping	7.7 Port Grouping
Firewall	<u> </u>	IX. Firewall
	General Policy	9.1 General Policy
		9.2 Restricted Application
	Access Rule	9.3 Access Rule
	Content Filter	9.4 Content Filter
VPN		X. VPN
	Summary	10.1.1 Summary
	Gateway to Gateway	10.1.2.1 Gateway to Gateway
	Client to Gateway	10.1.2.2 Client to Gateway
	PPTP Setup	10.1.3 PPTP Setup
	PPTP Status	10.1.3 PPTP Status
	VPN Pass Through	10.1.4 VPN Pass Through
QnoKey		10.2 QnoKey
	Summary	10.2.1 -10.2.3 QnoKey Group and Client
QVM VPN		10.3 QVM VPN
	QVM Setup	10.3.1 QVM VPN Server Setting
		10.3.3 QVM VPN Client Setting
	QVM Status	10.3.2 QVM Status
Advanced Function		XII. Advanced Setting
	DMZ Host	12.1 DMZ Host
	UPnP	12.2 UPnP
	Routing	12.3 Routing
	One to One NAT	12.4 One to One NAT
	Multiple to One NAT	12.4 One to One NAT
	DDNS	12.5 DDNS
	MAC Clone	12.6 MAC Clone
	· · · · · · · · · · · · · · · · · · ·	-

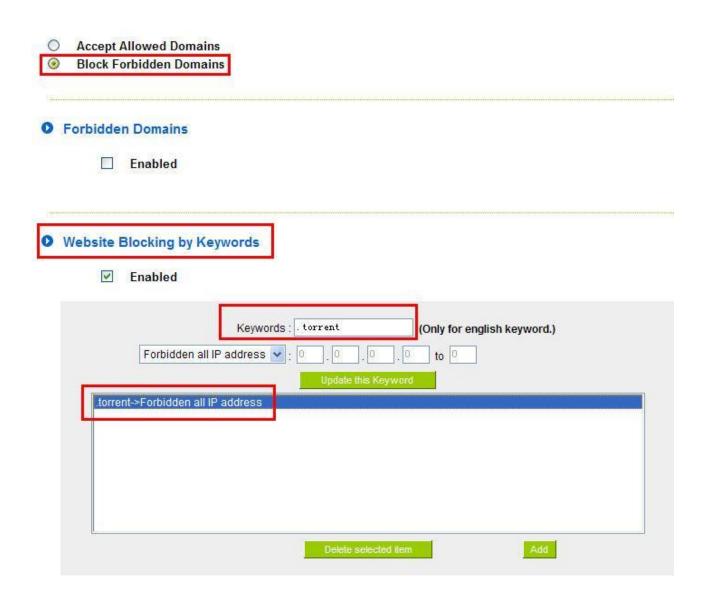

System Tool		XIII. System Tool
		V. Device Spec Verification, Status Display and
		Login Password and Time Setting
	Password	5.2 Change and Set Login Password and Time
	Diagnostic	13.1 Diagnostic
	Firmware Upgrade	13.2 Firmware Upgrade
	Setting Backup	13.3 Setting Backup
	Time	5.2 Change and Set Login Password and Time
	System Recover	13.4 System Recover
Port Management		VII. Intranet Configuration
	Setup	7.1 Setup
	Status	7.2 Status
Log		XIV. Log
	System Log	14.1 System Log
	System Status	14.2 System Status
	Traffic Statistic	14.3 Traffic Statistic
	IP/Port statistic	14.4 IP/Port statistic
	QRTG	14.5 QRTG

Appendix II: Troubleshooting

(1) Block BT Download

To block BT and prevent downloading by users, go to the "Firewall -> Content Filter" and select "Enable Website Block by Keywords," followed by the input of "torrent." This will prevent the users from downloading.

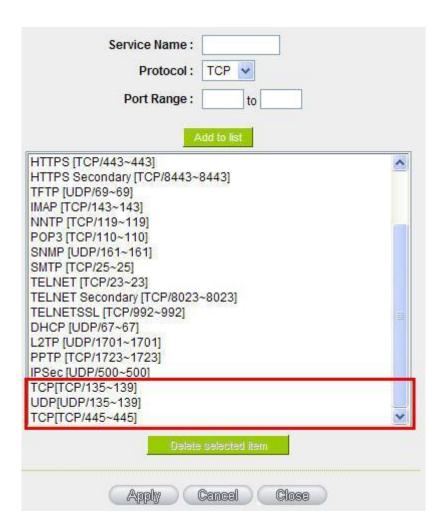

(2) Shock Wave and Worm Virus Prevention

Since many users have been attacked by Shock Wave and Worm viruses recently, the internet transmission speed was brought down and the Session bulky increase result in the massive processing load of the device. The following guides users to block this virus' corresponding port for prevention.

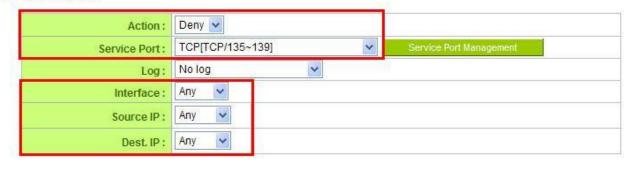

a. Add this TCP135-139, UDP135-139 and TCP445 Port.

b. Use the "Access Rule" in the firewall and set to block these three ports.

O Access Rule

Scheduling

Use the same method to add UDP [UDP135~139] and TCP [445~445] Ports.

c. Enhance the priority level of these three to the highest.

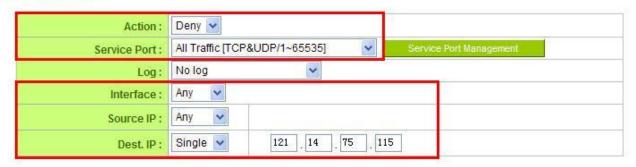

(3) Block QQLive Video Broadcast Setting

QQLive Video broadcast software is a stream media broadcast software. Many clients are bothered by the same problem: When several users apply QQLive Video broadcast software, a greater share of the bandwidth is occupied, thus overloading the device. Therefore, the device responds more slowly or is paralyzed. If the login onto the QQLive Server is blocked, the issue can be resolved. The following relates to Qno products and provides users with solutions by introducing users how to set up the device.

a). Log into the device web-based UI, and enter "Firewall -> Access Rule".

O Access Rule

Scheduling

b). Click "Add New Rule" under "Access Rule" page. Select "Deny" in "Action" under the "Service" rule setting, followed by the selection of "All Traffic [TCP&UDP/1~65535]" from "the service" and select "Any" for Interface, "Any" for source IP address (users with relevant needs may select either "Single" or "Range" to block any QQLive login by using one single IP or IP range), followed by the selection of "Single" of the "Dest. IP and enter the IP address as 121.14.75.155" for the QQLive Server (note that there are more than one IP address for QQLive server. Repeated addition may be needed). Lastly, select "Always" under the Scheduling setting so that the QQLive Login Time can be set. (If necessary, specific time setting may be undertaken). Click "Apply" to move to the next step.

c). Input the following IP address in **Dest. IP** repeatedly.

cache.tv.qq.com	loginqqlivedx.qq.com	qqlive.qq.com
58.60.11.145	219.133.49.159	219.133.62.70
58.60.11.146	loginqqlivewt.qq.com	tv1-3t.qq.com
58.60.11.147	58.251.63.13	221.236.11.40
59.36.97.5	loginqqlivexy.qq.com	tv2.qq.com
59.36.97.7	202.205.3.218	218.17.209.17
59.36.97.37		
219.133.63.48		

After repeated addition, users may see the links to the QQLive Server blocked. Click "Apply" to block QQLive video broadcast.

(4) ARP Virus Attack Prevention

1. ARP Issue and Information

Recently, many cyber cafes in China experienced disconnection (partially or totally) for a short period of time, but connection is resumed quickly. This is caused by the clash with MAC address. When virus-contained MAC mirrors to such NAT equipments as host devices, there is complete disconnection within the network. If it mirrors to other devices of the network, only devices of this affected network have problems. This happens mostly to legendary games especially those with private servers. Evidently, the network is attacked by ARP, which aims to crack the encryption method. By doing so, they hackers may intercept the packet data and user information through the analysis of the game's communication protocol. Through the spread of this virus, the detailed information of the game players within the local network can be obtained. Their account and information are stolen. The following describes how to prevent such virus attack.

First, let us get down to the definition of ARP (Address Resolution Protocol). In LAN, what is actually transmitted is "frame", in which there is MAC address of the destination host device. So-called "Address Analysis" refers to the transferring process of the target IP address into the target MAC address before the host sends out the frame. The basic function of ARP protocol aims to inquire the MAC address of the target equipment via the IP address of the target equipment so as to facilitate the communications.

The Working Principle of ARP Protocol: Computers with TCP/IP protocol have an ARP cache, in which the IP address corresponds to the MAC address (as illustrated).

IP	MAC
192.168.1.1	00-0f-3d-83-74-28
192.168.1.2	00-aa-00-62-c5-03
192.168.1.3	03-aa-01-75-c3-06

address of "192.168.1.1"? Other host devices do not respond to the ARP inquiry except host device B, which responds to host device A when receiving this frame: "The MAC address of 192.168.1.1 is 00-aa-00-62-c6-09". So Host A knows the MAC address of Host B, and it can send data to Host B. Meanwhile, it will update its ARP cache.

Moreover, ARP virus attack can be briefly described as an internal attack to the PC, which causes trouble to the ARP table of the PC. In LAN, IP address was transferred into the second physical address (MAC address) through ARP protocol. ARP protocol is critical to network security. ARP cheating is caused by fake IP addresses and MAC addresses, and the massive ARP communications traffic will block the network. The MAC address from the fake source sends ARP response, attacking the high-speed cache mechanism of ARP. This usually happens to the cyber cafe users. Some or all devices in the shop experience temporal disconnection or failure of going online. It can be resolved by restarting the device; however, the problem repeats shortly after. Cafe Administrators can use arp —a command to check the ARP table. If the device IP and MAC are changed, it is the typical symptom of ARP virus attack.

Such virus program as PWSteal. lemir or its transformation is worm virus of the Trojan programs affecting Windows 95/ 98/ Me/ NT/ 2000/ XP/ 2003. There are two attack methods affecting the network connection speed: cheat on the ARP table in the device or LAN PC. The former intercepts the gateway data and send ceaselessly a series of wrong MAC messages to the device, which sends out wrong MAC address. The PC thus cannot receive the messages. The later is ARP attack by fake gateways. A fake gateway is established. The PC which is cheated sends data to this gateway and doesn't go online through the normal device. From the PC end, the situation is "disconnection".

For these two situations, the device and client setup must be done to prevent ARP virus attack, which is to guarantee the complete resolution of the issue. The device selection is advised to take into consideration the one with anti-ARP virus attack. Qno products come squarely with such a feature, which is very user-friendly compared to other products.

2. ARP Diagnostic

If one or more computers are affected by the ARP virus, we must learn how to diagnose and take appropriate measures. The following is experience shared by Qno technical engineers with regard to the ARP prevention.

Through the ARP working principle, it is known that if the ARP cache is changed and the device is constantly notified with the series of error IP or if there is cheat by fake gateway, then the issue of disconnection will affect a great number of devices. This is the typical ARP attack. It is very easy to judge if there is ARP attack. Once users find the PC point where there is problem, users may enter the DOS system to conduct operation, pining the LAN IP to see the packet loss. Enter the ping 192.168.1.1 (Gateway IP address) as illustrated.

```
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Request timed out.
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
Reply from 192.168.1.1: bytes=32 time<1ms TTL=64
```

If there are cases of packet loss of the ping LAN IP and If later there is connection, it is possible that the system is attacked by ARP. To verify the situation, we may judge by checking ARP table. Enter the ARP -a command as illustrated below.

It is found that the IP of 192.168.1.1 and 192.168.252 points to the same MAC address as 00-0f-3d-83-74-28. Evidently, this is a cheat by ARP.

3. ARP Solution

Now we understand ARP, ARP cheat and attack, as well as how to identify this type of attack. What comes next is to find out effective prevention measures to stop the network from being attacked. The general solution provided by Qno can be divided into the following three options:

a) Enable "Prevent ARP Virus Attack":

Enter the device IP address to log in the management webpage of the device. Enter "Firewall-> General" and find the option "Prevent ARP Virus Attack" to the right of the page. Click on the option to activate it and click "Apply" at the bottom of the page (see illustrated).

Firewall:	Enabled
SPI (Stateful Packet Inspection):	Enabled Disabled
DoS (Denial of Service):	Enabled
Block WAN Request:	Enabled
Remote Management :	○ Enabled
Multicast Pass Through:	O Enabled Disabled
Prevent ARP Virus Attack :	Enabled
	Router sends ARP 20 times per-second.

b) Bind the Gateway IP and MAC address for each PC

This prevents the ARP from cheating IP and its MAC address. First, find out the gateway IP and MAC address on the device end.

LAN Setting

MAC Address:	30 _7e _95 _99 _94 _be (Default: 30-7e-95-99-94-be)
Device IP Address :	192 . 168 . 1 . 1
Subnet Mask :	255 255 255 0

On every PC, start or operate cmd to enter the dos operation. Enter arp -s 192.168.1.1 0a-0f-d4-9e-fb-0b so as to finish the binding of pc01 as illustrated.

For other host devices within the network, follow the same way to enter the IP and MAC address of the corresponding device to complete the binding work. However, if this act restarts the computer, the setting will be cancelled. Therefore, this command can be regarded as a batch of processing documents placed in the activation of the operation system. The batch processing documents can be put in this way:

@echo off

arp -d

arp -s Router LAN IP Router LAN MAC

For those internal network attacked by Arp, the source must be identified. Method: If the PC fails to go online or there is packet loss of ping, in the DOS screen, input arp —a command to check if the MAC address of the gateway is the same with the device MAC address. If not, the PC corresponding to the MAC address is the source of attack.

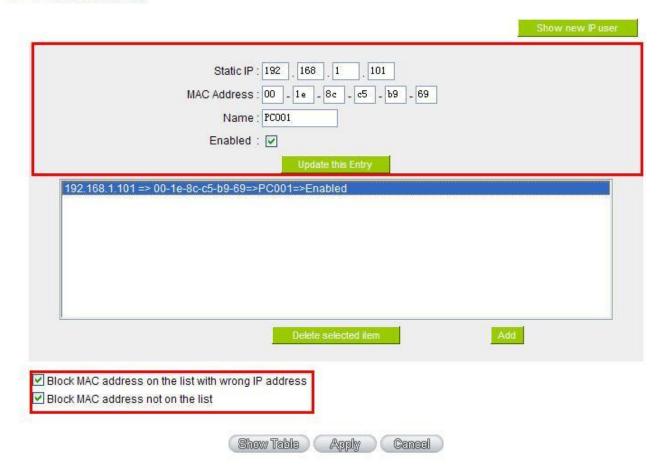

Solutions for other device users are to make a two-way binding of the IP address and MAC address from both of the PC and device ends in order to carry out the prevention work. However, this is more complicated because the search for the IP and address and MAC increases the workload. Moreover, there is greater possibility of making errors during the operation.

c) Bind the IP/MAC Address from Device End:

Enter "Setup" under DHCP page. On the down right corner of the screen, there is "IP and MAC Binding," where users may create IP and MAC binding. On "Enabled," click on "V" and select "Add to List." Repeat these steps to add other IP addresses and MAC binding, followed by clicking "Apply" at the bottom of the page.

O IP & MAC Binding

After an item is added to the list, the corresponding message will be displayed in the white block on the bottom. However, such method is not recommended because the inquiry of IP/MAC addresses of all hosts creates heavy workload. Another method to bind IP and MAC is more recommended because of easy operation, reducing workload and time efficiency. It is described in the following.

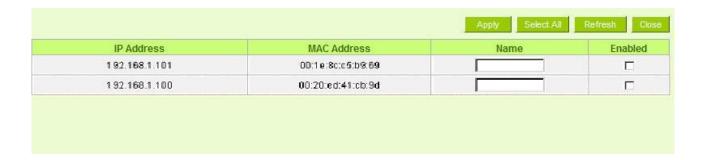

Enter "Setup" under the DHCP page and look for IP and MAC binding. On the right, there is an option of "Show new IP user" and click to enter.

IP & MAC Binding

Static IP:	
MAC Address:	
Name :	
Enabled :	
Add to list	
Delete salected item	
lock MAC address on the list with wrong IP address	
lock MAC address not on the list	
Show Table Apply Cancel	

Click to display IP and MAC binding list dialog box. In this box, the unbinding IP and MAC address corresponding to the PC are displayed. Enter the "Name" of the computer and click on "Enabled" with the display of the "V" icon and push the option on the top right corner of the screen to confirm.

Now the bound options will display on the IP and MAC binding list (as illustrated in Figure 5) and click "Apply" to finish binding.

O IP & MAC Binding

				Show new IP us
	Static IF	9: 192 168 1 100		
			0.1	
	MAC Address		_ 9d	
	Name	PC002		
	Enabled	: ☑		
		Update this Entry		
192.168.1.100 =	> 00-20-ed-41-cb-9d=	>PC002=>Enabled		
		Delete selected item	Ad	d
ock MAC address	on the list with wrong	IP address		
lock MAC address	not on the list			

Though these basic operations can help solve the problem but Qno's technical engineers suggest that further measures should be taken to prevent the ARP attack.

- 1. Deal with virus source as well as the source device affected by virus through virus killing and the system re-installation. This operation is more important because it solves the source PC which is attacked by ARP. This can better shelter the network from being attacked.
- 2. Cyber café administrators should check the LAN virus, install anti-virus software (Ginshan Virus/Reixin must update the virus codes) and conduct virus scanning for the device.
- 3. Install the patch program for the system. Through Windows Update, the system patch program (critical update, security update and Service Pack)
- 4. Provide system administrators with a sophisticated and strong password for different accounts. It would be best if the password consists of a combination of more than 12 letters, digits, and symbols. Forbid and delete some

redundant accounts.

- 5. Frequently update anti-virus software (virus data base), and set the daily upgrade that allows regular and automatic update. Install and use the network firewall software. Network firewall is important for the process of anti-virus. It can effectively avert the attack from the network and invasion of the virus. Some users of the pirate version of Windows cannot install patches successfully. Users are advised to use network firewall and other measures for protection.
- 6. Close some unnecessary services and some unnecessary sharing (if the condition is applicable), which includes such management sharing as C\$ and D\$. Single device user can directly close Server service.
- 7. Do not open QQ or the link messages sent by MSN online chatting tools in a causal manner. Do not open or execute any strange, suspicious documents, and procedures such as the unknown attachment enclosed in E-mail and plug-in.

4. Summary

ARP attack prevention is a serious and long-term undertaking. The above methods can basically resolve the network problems caused by ARP virus attack. Moreover, clients who adopted similar methods witness good results. However, it is important that network administrators pay special attention to this problem rather than overlooking the issue. It is suggested that the above measures can be adopted to prevent ARP attack, reduce the damage, enhance the work efficiency, and minimize economic loss.

Appendix III: Qno Technical Support Information

For more information about the Qno's product and technology, please log onto the Qno's bandwidth forum, refer to the examples of the FTP server, or contact the technical department of Qno's dealers as well as the Qno's Mainland technical center.

Qno Official Website

http://www.Qno.com.tw

Dealer Contact

Users may log on to the service webpage to check the contacts of dealers.
